Reading Paths by Role

About the Author

Part I — Foundations

Chapter 1 — Why AI Matters for Bangsamoro Governance

1.1 The Gap This Guidebook Fills
1.2 What AI Can and Cannot Do for Government
1.3 Where BARMM Stands Today
1.4 The Governance Cycle as This Guidebook's Spine
1.5 Who This Guidebook Is For
1.6 How to Use This Guidebook

Chapter 2 — AI Literacy for Government Staff

2.1 What Is AI, in Plain Language
2.2 How AI Reads, Writes, and Reasons
2.3 Types of AI Tools for Government Work
- 2.3.1 Text Generation and Drafting
- 2.3.2 Document Analysis and Summarization
- 2.3.3 Research Synthesis
- 2.3.4 Translation and Accessibility

2.4 The Prompt as a Government Instruction
2.5 Hands-On: Your First Government Prompt
2.6 Common Misconceptions and How to Address Them

Chapter 3 — The AI-Augmented Workflow

3.1 The Human-AI Partnership Model
3.2 The Four-Step AI Workflow for Government Tasks
3.2.1 Step 1: Prepare Context
3.2.2 Step 2: Prompt Clearly
3.2.3 Step 3: Review Critically
3.2.4 Step 4: Refine Iteratively
3.3 When to Use AI and When Not To
3.4 Quality Assurance: The "Trust but Verify" Protocol
3.5 Document Management and AI Outputs
3.6 Building AI Into Existing Processes, Not Replacing Them

Chapter 4 — Data, Documents, and the BARMM Knowledge Base

4.1 The Document Universe of BARMM Governance
4.2 Preparing Government Documents for AI Analysis
4.3 Building an Institutional Knowledge Base
4.4 Data Privacy and Information Classification
4.5 Working with Philippine and Bangsamoro Legal Texts

Part II — AI Across the Governance Cycle

Chapter 5 — AI for Strategic Planning and Development

5.1 AI in the Planning Cycle
5.2 Environmental Scanning and Situational Analysis with AI
5.3 AI-Assisted Development Plan Formulation
5.3.1 Vision and Mission Drafting
5.3.2 Aligning PPAs with BDP 2023-2028 Goals
5.3.3 Identifying Gaps in Mandate Coverage
5.4 Theory of Change Design with AI
5.5 Data-Driven Needs Assessment
5.6 Limitations: What Planning Decisions AI Cannot Make

Chapter 6 — AI for Budgeting and Financial Analysis

6.1 The Bangsamoro Budget Cycle and Where AI Enters
6.1.1 Budget Preparation
6.1.2 Budget Authorization
6.1.3 Budget Execution
6.1.4 Budget Accountability
6.2 AI-Assisted Budget Proposal Development

6.3 Budget Analysis and Comparison
6.4 Preparing Budget Briefers with AI
6.5 Revenue Analysis and Fiscal Forecasting
6.6 Audit Preparation and COA Compliance

Chapter 7 — AI for Legislative and Policy Work

7.1 AI in the Legislative Process
7.2 Legislative Research with AI
7.2.1 Policy Landscape Scanning
7.2.2 Comparative Legislation Analysis
7.2.3 Cross-Referencing the 89 Enacted BAAs
7.3 AI-Assisted Bill Drafting
7.4 Preparing Legislative Briefers with AI
7.5 AI for Interpellation and Plenary Preparation
7.6 Policy Recommendation Drafting with AI

Chapter 8 — AI for Program Implementation and Service Delivery

8.1 From Approved Plan to Implemented Program
8.2 AI for Project Management and Coordination
8.3 AI-Assisted Procurement Documentation
8.4 AI for Human Resource Management
8.5 AI for Government Communications
8.6 AI for Intergovernmental Coordination

Chapter 9 — AI for Monitoring and Evaluation

9.1 Why M&E Is the Most AI-Ready Governance Function
9.2 AI-Assisted Performance Monitoring
9.3 Program Evaluation with AI
9.4 AI for Reporting and Compliance
9.5 Data Visualization and Presentation
9.6 The Feedback Loop: From M&E Data to Plan Revision

Chapter 10 — AI for Oversight and Accountability

10.1 Parliament's Oversight Function and AI
10.2 AI-Assisted Audit Analysis
10.3 AI for Transparency and Open Government
10.4 AI for Anti-Corruption and Compliance Monitoring
10.5 AI for Institutional Memory and Transition Safeguarding
10.6 The Accountability Chain: From AI Analysis to Formal Action

Chapter 11 — AI for Legislation and Codification

11.1 The Legislative Output of the BTA and What Comes Next
11.2 AI for Codification and Legal Harmonization
11.3 AI for IRR Development
11.4 AI for Resolution Drafting and Parliamentary Operations
11.5 AI for Legislative Tracking and Status Reporting
11.6 Closing the Cycle: How Enacted Legislation Becomes Planning Input

Part III — Governance, Implementation, and the Road Ahead

Chapter 12 — Ethics, Islamic Values, and Responsible AI

12.1 Moral Governance and AI
- 12.1.1 The 12 Pillars Applied to AI Adoption
- 12.1.2 Transparency and Honesty in AI-Assisted Outputs

12.2 Islamic Principles for AI Use
- 12.2.1 Amanah — Trustworthiness in AI Outputs
- 12.2.2 Adl — Justice in AI-Assisted Decisions
- 12.2.3 Shura — Consultation Before AI Deployment
- 12.2.4 Maslahah — Public Interest as the Test for AI Adoption

12.3 The Enhanced 12-Point Priority Agenda and AI Alignment
12.4 Risks and Safeguards
12.5 A Bangsamoro AI Ethics Framework
12.6 When AI Must Not Decide

Chapter 13 — Getting Started: An Implementation Roadmap

13.1 The Three Maturity Levels
- 13.1.1 Level 1: Individual Use and Personal Productivity
- 13.1.2 Level 2: Team Integration and Shared Workflows
- 13.1.3 Level 3: Institutional Adoption and Policy-Backed Deployment

13.2 Level 1 — Individual Quick Wins
13.3 Level 2 — Team-Level Integration
13.4 Level 3 — Institutional Adoption
13.5 The 90-Day AI Adoption Plan for a BARMM Office
13.6 Change Management: Addressing Resistance and Building Champions

Chapter 14 — Training, Capacity Building, and Sustaining AI Skills

14.1 AI Literacy as a Core Government Competency
14.2 Designing AI Training Programs for Government Staff
14.3 The Supervisor's Role in AI Adoption

14.4 Building Communities of Practice
14.5 Keeping Up with AI Evolution
14.6 Measuring AI Impact

Chapter 15 — The Future: AI-Augmented Bangsamoro Governance

15.1 Where AI Governance Is Heading
15.2 Digital Governance and e-Bangsamoro
15.3 AI and the First Regular Government
15.4 From Guidebook to Practice: A Challenge to Every Reader

Reference

Glossary of AI and Digital Governance Terms

Appendices

Appendix A — Prompt Library for Common Government Tasks

A.1 Planning and Strategy Prompts
A.2 Budgeting and Finance Prompts
A.3 Legislative and Policy Prompts
A.4 Administrative and Correspondence Prompts
A.5 Research and Reporting Prompts
A.6 M&E and Oversight Prompts

Appendix B — Tool Setup Guides

B.1 Claude (Web and Desktop)
B.2 NotebookLM
B.3 Obsidian as a Government Knowledge Base

Appendix C — AI Readiness Assessment Checklist

Appendix D — Sample AI Policy for a BARMM Office

Appendix E — AI-Assisted CSW: ADDRESS IT with AI at Every Step

E.1 Analyze Context with AI
E.2 Define/Deliberate the Problem with AI
E.3 Research with AI
E.4 Explore Options with AI
E.5 Submit with AI-Assisted Quality Review

E.6 Sustain Implementation with AI Monitoring
E.7 Iterate and Improve with AI Feedback Loops

Appendix F — AI-Assisted Legislative Briefer: 13-Section Template with Prompts

Appendix G — AI-Assisted Budget Briefer: BB-Coded Template with Prompts

Appendix H — 90-Day AI Adoption Plan Template

Appendix I — AI Training Workshop Design (3-Day Program)

I.1 Day 1: AI Literacy and First Prompts
I.2 Day 2: AI for Your Governance Function
I.3 Day 3: Team Workflow Integration and Policy Drafting

Appendix J — BARMM Legal Framework Quick Reference for AI Users

Appendix K — The Author's AI Toolkit: From 129 Skills to Governance Innovation

Appendix L — Cross-Reference Index to Other BARMM Guidebooks

Bibliography and References

About This Guidebook

Purpose and Scope

This guidebook bridges two worlds that rarely speak to each other in the Bangsamoro Autonomous Region in Muslim Mindanao: **artificial intelligence** and **government operations**.

The 2nd Bangsamoro Development Plan (2023-2028) dedicates Chapter 8 to technology and innovation — but its focus is on science labs, research scholarships, and metrology facilities. It says nothing about how AI can transform the daily work of government staff. This guidebook fills that gap.

You will learn how AI tools can assist you at every stage of the governance cycle — from strategic planning and budgeting, through program implementation and monitoring, to legislative oversight and codification. Not as a replacement for your judgment, but as a force multiplier for your expertise.

Every chapter is grounded in real BARMM governance work. The examples come from actual BAAs, resolutions, budget documents, and institutional processes. The case studies draw from platforms already built for Bangsamoro institutions. This is not a theoretical manual about what AI might do someday. It is a practical guide about what AI can do for you right now.

Who This Guidebook Is For

This guidebook serves **all BARMM government staff** — from administrative aides to ministers, from committee secretariat to the Office of the Chief Minister. AI is not an IT concern. It is a productivity tool for anyone who reads, writes, analyzes, or decides.

You do not need technical skills to use this guidebook. If you can write a memorandum, you can write an AI prompt. Chapter 2 starts from zero.

AI Declaration

This guidebook was produced with AI assistance. The author used AI tools (Claude Code, Anthropic) for drafting AI application frameworks across the governance cycle, structuring prompt engineering guides, formatting case studies, and organizing the ethical and implementation chapters.

AI did not design the methodology. The mapping of AI capabilities to each stage of the governance cycle – strategic planning, budgeting, program implementation, monitoring and evaluation, legislative oversight, and codification – comes from the author's professional experience building AI-augmented platforms for Bangsamoro institutions. AI accelerated the writing. It did not direct the thinking.

Every BAA reference, budget document citation, institutional process description, and governance claim in this guidebook was verified by the author against the Bangsamoro Organic Law (RA 11054), enacted Bangsamoro Autonomy Acts, the Bangsamoro Development Plan 2023-2028, and official government records. The author bears full responsibility for the accuracy and completeness of the published content.

For the author's full professional standards on AI-augmented governance, legislation, and development work, see *How to Use AI in Governance, Legislation, and Development Work in the Bangsamoro* (Saidamen R. Mambayao, 2026).

How to Use This Guidebook

You have two options:

Sequential reading — Start with Part I (Chapters 1-4) to build your AI literacy, then work through Part II (Chapters 5-11) for your governance function, and finish with Part III (Chapters 12-15) for ethics and implementation. This is recommended for first-time readers.

Chapter-pick reading — Go directly to the chapter that matches your current work. Each chapter is self-contained, with cross-references to related chapters when you need deeper context.

Reading Paths by Role

Your Role	Start Here	Then Read	Appendices for You
Administrative aide / clerk	Ch 2 (AI Literacy), Ch 3 (Workflow)	Ch 8 (Implementation)	App A (Prompts), App B (Tool Setup)
Research / policy analyst	Ch 2 (AI Literacy), Ch 4 (Knowledge Base)	Ch 7 (Legislative), Ch 9 (M&E)	App E (CSW+AI), App F (Briefer)
Budget officer	Ch 2 (AI Literacy), Ch 6 (Budgeting)	Ch 9 (M&E), Ch 10 (Oversight)	App G (Budget Briefer), App A (Prompts)
Legislative staff	Ch 2 (AI Literacy), Ch 7 (Legislative)	Ch 11 (Codification), Ch 4 (Knowledge Base)	App F (Briefer), App E (CSW+AI)
Program / project manager	Ch 2 (AI Literacy), Ch 8 (Implementation)	Ch 5 (Planning), Ch 9 (M&E)	App H (90-Day Plan), App A (Prompts)
Division chief / director	Ch 1 (Why AI), Ch 3 (Workflow)	Ch 13 (Roadmap), Ch 14 (Training)	App C (Readiness), App D (AI Policy)
Minister / MP / executive	Ch 1 (Why AI), Ch 12 (Ethics)	Ch 13 (Roadmap), Ch 15 (Future)	App C (Readiness), App D (AI Policy)
IT officer / BICTO staff	Ch 4 (Knowledge Base), Ch 13 (Roadmap)	Ch 14 (Training), Ch 12 (Ethics)	App B (Tool Setup), App J (Legal Framework)

What This Guidebook Is Not

This guidebook does **not** teach you how to build AI systems, write code, or train machine learning models. It teaches you how to **use** AI tools to do your existing government work better, faster, and with higher quality.

It does **not** replace your professional judgment. Every AI output must pass through your expertise before it becomes an official government document. Chapter 3 explains this in detail.

It does **not** endorse any single AI vendor or platform. The patterns you learn here work across tools. Specific tools appear only in boxed case studies and appendices, and they will evolve. The principles will not.

About the Author

Saidamen "Sayeed" R. Mambayao has worked in governance, legislation, technology, and development across the Bangsamoro region for over a decade. He is currently a Consultant at the Office of the Chief Minister — Office for Other Bangsamoro Communities (OOBC), where he leads policy development, strategic planning, and institutional strengthening for Bangsamoro communities living outside BARMM.

He previously served as OIC-Legislative Affairs at the Bangsamoro Parliament (2025), where he drafted the Bangsamoro Early Childhood Care and Development Bill, created a 39,000-word Bill-Drafting Manual for parliamentary staff, and built the Parliamentarian app — a constitutional research platform with AI agents for legal analysis and BOL interpretation. Before that, he served as Supervising Political Affairs Officer III / Chief of Staff (SG 25) for MP Diamila Disimban-Ramos (2022-2025), leading the drafting of bills on cultural heritage, cooperative development, social justice for Other Bangsamoro Communities, and OBC peace and culture centers.

His government career spans the Ministry of Basic, Higher, and Technical Education (MBHTE), where he directed the Access to Higher and Modern Education Scholarship Portal, and the Ministry of the Interior and Local Government (MILG), where he managed the ESKEY program and served as lead drafter and secretariat head of the Bangsamoro Local Governance Code.

Saidamen is also a full-stack software developer who has built eight government-scale platforms for Bangsamoro institutions, including e-Bangsamoro (a four-portal e-governance system), BangsamoroHR, MoroMarket (a digital marketplace for cooperatives and social enterprises), and Tarbiyyah-MS (a madrasah management system). He maintains 129 AI skills for Claude Code — a library that powers the AI-augmented workflows described throughout this guidebook.

He is the Founder of MoroTech and MoroAcademy (social enterprises empowering Bangsamoro communities through technology and knowledge), the Chairperson of the Moro Developers Community, and the Chairperson of the Bangsamoro Scholars Association. He is the author of seven BARMM guidebooks covering bill drafting, complete staff work, supervision, speech writing, policy recommendations, manual of operations formulation, and strategic planning.

This guidebook is written from the intersection of all three domains — governance, technology, and development — that have defined his career. It is the guidebook he wishes existed when he first started building AI tools for Bangsamoro institutions.

Introduction

You work inside one of the most ambitious governance experiments in Southeast Asia. The Bangsamoro Autonomous Region in Muslim Mindanao created 16 executive units, stood up a parliamentary system, enacted 89 Bangsamoro Autonomy Acts, filed over 570 resolutions, and built an entire bureaucracy — all within six years of a transition period.[^1] That is an extraordinary volume of institutional work. And nearly all of it was done the traditional way: manually, document by document, meeting by meeting, draft by draft.

This chapter explains why AI should become part of that work. Not as a replacement for the people doing it. As a force multiplier for the expertise they already have.

1.1 The Gap This Guidebook Fills

The 2nd Bangsamoro Development Plan (BDP) 2023-2028 dedicates Chapter 8 to "Harnessing Technology and Innovations to Increase Socioeconomic Opportunities and Improve Government Services."[^2] Read the chapter closely and you will find something remarkable: the word "artificial intelligence" does not appear. Neither does "AI," "machine learning," "large language model," or "digital governance."

Chapter 8 focuses on **science, technology, and innovation (STI)** — and it frames technology almost entirely through a physical infrastructure lens:

- **Science labs.** The entire region operates one science laboratory facility, the Bangsamoro Science High School Technology Laboratory (BSHTL) in Cotabato City.^3 The BDP targets three by 2028.
- **Research scholarships.** The BASE Scholarship and a regional STEAME program aim to grow the pipeline of science graduates.[^4]
- **A science park.** The BDP envisions a technology business incubator to nurture startups and connect them with research institutions.[^5]
- **Metrology services.** Testing, calibration, and quality assurance for micro, small, and medium enterprises.[^6]

These are legitimate priorities. A region with only 0.23% of GRDP allocated to research and development needs physical infrastructure before anything else.^7 But the BDP's technology chapter stops at the laboratory door. It does not address how the *existing* government workforce can use AI tools *right now* — with nothing more than a laptop, an internet connection, and a structured approach to prompting.

This is the gap. The BDP tells BARMM how to build a science ecosystem. This guidebook tells you how to use AI to do your job better today.

Consider the contrast:

BDP Chapter 8 Covers	This Guidebook Covers
Establishing science laboratories	Using AI to analyze legislation
Funding research scholarships	Using AI to draft budget briefers
Building a science park	Using AI to prepare Complete Staff Work
Creating a metrology lab	Using AI to cross-reference 89 BAAs
STI governance strengthening	AI-augmented governance workflows
STEAME course enrollment targets	AI literacy for all government staff

The BDP's ten priority challenges for STI include "weak STI culture," "low investment in R&D," and "inadequate STI infrastructure."[^8] All valid. But the most immediate technology challenge facing BARMM staff is not a missing science park. It is this: **thousands of government employees produce documents, analyze data, and draft policy every day — and almost none of them use AI to do it faster or better.**

This guidebook addresses that challenge directly.

1.2 What AI Can and Cannot Do for Government

Before you read further, set aside two assumptions that derail most conversations about AI in government. The first is hype: the belief that AI will automate everything and make human expertise unnecessary. The second is fear: the belief that AI is too unreliable, too foreign, or too dangerous for serious government work.

Both are wrong. Here is what AI actually does well, and where it falls short.

What AI Does Well

Drafting at speed. AI can produce a first draft of a memorandum, a legislative briefer, a policy recommendation, or a budget narrative in minutes. A task that takes a policy analyst three days — gathering references, organizing sections, writing prose — takes 30 minutes with a well-structured prompt and the right reference documents. You still review every word. But you start from a complete draft instead of a blank page.

Synthesizing large volumes of text. Give AI the full text of the Bangsamoro Organic Law (Republic Act No. 11054) and ask it to find every provision related to education. It will return a structured list in seconds.[^9] Ask it to compare Article IX (Basic Rights) with Article X (Bangsamoro Justice System) for overlapping mandates. It will map the connections. Government staff already do this manually — but they do it slowly, and they miss things.

Cross-referencing legislation. BARMM has enacted 89 BAAs across domains as diverse as administrative structure, civil service, education, public finance, and special governance areas.[^10] No single staff member has read all 89. AI can search across the full corpus for provisions that conflict, overlap, or create implementation gaps. This is not a theoretical capability. The author uses AI to cross-reference enacted BAAs in real legislative analysis work.

Structuring information. Raw meeting notes, unformatted data tables, scattered research findings — AI transforms messy inputs into organized outputs. It converts a 90-minute committee hearing transcript into a structured summary with action items. It reformats a spreadsheet of provincial budget data into a narrative budget analysis. Structure is what makes government documents useful, and AI is relentlessly good at imposing structure.

Translation and paraphrasing. BARMM operates across English, Filipino, and Arabic. AI handles all three. It can translate a Filipino speech into English, render a technical legal provision into plain language for a community briefing, or convert an Arabic prayer text into English with proper attribution.

What AI Cannot Do

Make decisions. AI has no authority, no mandate, no electoral legitimacy, and no accountability. It cannot decide whether a budget allocation is just. It cannot weigh the political feasibility of a proposed amendment. It cannot judge whether a program serves the community's real interests or just looks good on paper. **Decisions belong to humans.** Full stop.

Guarantee accuracy. AI generates plausible-sounding text. Sometimes that text is wrong. It may cite a BAA number that does not exist. It may attribute a provision to Article V when it belongs to Article VII. It may invent a statistic. This is not a flaw you can fix by choosing a better AI tool. It is a structural characteristic of how large language models work. **Every AI output requires human verification.** Chapter 3 builds this into a formal protocol.

Understand local context. AI does not know that a particular barangay has been displaced three times by armed conflict. It does not know that a ministry has an informal working arrangement with a national agency that overrides the formal orgchart. It does not know that a proposed bill has strong support from one political bloc and fierce opposition from another. **Context is yours to supply.** The better you feed context into your prompts, the more useful the AI output becomes.

Replace institutional knowledge. A senior budget officer who has processed 15 annual appropriations knows which line items always get flagged by COA, which ministries consistently underspend, and which budget categories hide discretionary funds. AI does not have this knowledge unless you teach it. Your institutional memory is irreplaceable. AI amplifies it.

Take responsibility. When a document carries your name and your office's letterhead, you own its accuracy. If an AI-drafted briefer contains an error and a Member of Parliament quotes it in plenary, the accountability falls on the staff who submitted it — not on the AI. **The Rule of Signature applies always**: if you would not sign a document without reading it, do not submit an AI-generated document without reviewing it.

The Honest Assessment

AI is a productivity tool. Like a calculator, it handles volume and speed. Like a research assistant, it gathers and organizes. Like a writing partner, it helps you think through structure and framing. But it does not replace the calculator operator, the researcher, or the writer. It makes them faster.

For BARMM, the practical impact is this: **a ministry that uses AI well can produce the same quality of output with fewer hours of staff labor — or produce significantly higher quality with the same hours.** The constraint is no longer how fast your people can type. It is how well they can think, verify, and decide.

1.3 Where BARMM Stands Today

Understanding what AI can do requires understanding what BARMM has already built. You are not starting from zero. The Bangsamoro government has produced an extraordinary institutional infrastructure in its first six years.

The Bureaucracy

The Bangsamoro Transition Authority (BTA) governs through a **parliamentary system** — a fundamental departure from the unitary system of the former Autonomous Region in Muslim Mindanao (ARMM).[^11] The Chief Minister leads the executive branch. The Speaker presides over Parliament. The Cabinet is drawn from Members of Parliament, creating an integrated executive-legislative relationship.

The executive branch operates through **15 line ministries and 1 executive unit (the Office of the Chief Minister)**, for a total of 16 executive units:[^12]

Acronym	Ministry
MAFAR	Ministry of Agriculture, Fisheries, and Agrarian Reform
MBHTE	Ministry of Basic, Higher, and Technical Education
MENRE	Ministry of Environment, Natural Resources, and Energy
MFBM	Ministry of Finance, and Budget and Management
MOH	Ministry of Health
MHSD	Ministry of Human Settlements and Development
MIPA	Ministry of Indigenous Peoples' Affairs
MILG	Ministry of the Interior and Local Government
MOLE	Ministry of Labor and Employment

Acronym	Ministry
MPOS	Ministry of Public Order and Safety
MPW	Ministry of Public Works
MOST	Ministry of Science and Technology
MSSD	Ministry of Social Services and Development
MTIT	Ministry of Trade, Investments, and Tourism
MOTC	Ministry of Transportation and Communications

Beyond the ministries, the Office of the Chief Minister (OCM) oversees 10 attached agencies — including the **Bangsamoro Planning and Development Authority (BPDA)**, the **Bangsamoro Information and Communications Technology Office (BICTO)**, and the **Development Academy of the Bangsamoro (DAB)**.[^13] Four commissions (Women, Youth, Sports, Cultural Heritage) and two independent bodies (Human Rights, Internal Auditing) complete the organizational structure.[^14]

As of November 2022, BARMM authorized **50,467 positions** across these institutions, with 70.97% already filled (35,812 of 50,467).[^15] These are the people this guidebook serves.

The Legislative Output

The BTA Parliament has enacted **89 Bangsamoro Autonomy Acts (BAAs)** and approved over **260 resolutions** out of 748 filed.[^16] The legislative output covers:

- **Foundational codes.** The Bangsamoro Administrative Code (BAA No. 13), the Civil Service Code, and the Education Code establish the basic legal architecture.[^17]
- **Budget legislation.** Annual appropriations acts and the Budget System Act (BAA No. 84) define the fiscal framework.[^18]
- **Sector legislation.** Acts covering agriculture, health, environment, trade, culture, and public order create the policy foundation for each ministry.
- **Special governance acts.** The Bangsamoro Electoral Code (BAA No. 35) was enacted in 2023, bringing the total enacted priority codes to four. The Local Government Code, Revenue Code, and Investment Code remain among the priority codes still pending enactment.[^19]

Every one of these 89 BAAs is a document that government staff must read, interpret, implement, and occasionally amend. AI can help with all four tasks.

The Governance Cycle Already in Motion

BARMM does not need AI to start governing. It is already governing. The question is whether AI can make that governance faster, more thorough, and more consistent. The answer — demonstrated throughout this guidebook with real examples — is yes.

Here is a snapshot of the governance work already happening:

- **Planning.** The BPDA coordinates the 2nd Bangsamoro Development Plan with six development goals, eight strategies, and macroeconomic targets including 8-9% annual GRDP growth.[^20]
- **Budgeting.** MFBM manages the annual budget cycle under BAA No. 84, from budget call through execution to accountability.[^18]
- **Legislation.** The Parliament processes bills through committee hearings, plenary readings, and interpellation, producing enacted laws and resolutions.[^16]
- **Implementation.** Fifteen ministries implement programs, projects, and activities (PPAs) aligned with BDP goals.
- **Monitoring and evaluation.** BPDA tracks BDP targets against baselines, reporting progress on indicators like poverty incidence (29.80% baseline, 20-25% target by 2028) and GRDP growth.[^21]
- **Oversight.** Parliament conducts oversight through committee inquiries, budget reviews, and performance assessments.
- **Intergovernmental coordination.** Six of eight intergovernmental relations mechanisms under the BOL are fully operational, including the IGRB and the Philippine Congress-Bangsamoro Parliament Forum.[^22]

This is the governance reality AI enters. Not a blank slate. A moving machine.

1.4 The Governance Cycle as This Guidebook's Spine

This guidebook is not organized by AI capability. It is organized by **governance function**. The reason is simple: you do not wake up thinking, "I want to use natural language processing today." You wake up thinking, "I need to finish the budget briefer by Thursday."

The seven stages of the governance cycle form the spine of Part II (Chapters 5-11):

```
┌──────────────────────────────────────────────────┐
│                 GOVERNANCE CYCLE                 │

└──────────────────────────────────────────────────┘
```

Stage 1 — Planning. Environmental scanning, development plan formulation, needs assessment, theory of change design. AI helps you scan documents, identify gaps, and draft strategic frameworks. *Chapter 5.*

Stage 2 — Budgeting. Budget preparation, proposal development, fiscal analysis, revenue forecasting. AI helps you build budget narratives, analyze spending patterns, and prepare budget briefers. *Chapter 6.*

Stage 3 — Approval. Legislative review, committee hearings, interpellation, plenary debate, bill enactment. AI helps you draft bills, prepare legislative briefers, and build interpellation strategies. *Chapter 7.*

Stage 4 — Implementation. Program execution, procurement, HR management, service delivery, intergovernmental coordination. AI helps you manage projects, draft communications, and track progress. *Chapter 8.*

Stage 5 — Monitoring and Evaluation. Performance monitoring, program evaluation, data visualization, compliance reporting. AI helps you track indicators, generate reports, and identify trends. *Chapter 9.*

Stage 6 — Oversight. Parliamentary oversight, audit analysis, transparency, anti-corruption, institutional memory. AI helps you analyze audit findings, prepare oversight reports, and safeguard institutional knowledge. *Chapter 10.*

Stage 7 — Legislation. Codification, legal harmonization, IRR development, resolution drafting, legislative tracking. AI helps you systematize enacted laws, draft implementing rules, and close the cycle by feeding enacted legislation back into planning. *Chapter 11.*

The cycle is continuous. An M&E finding becomes a planning input. An oversight discovery becomes a legislative proposal. A budget analysis reveals an implementation gap. **AI's value multiplies across the cycle because the output of one stage feeds the input of the next.** An AI-generated budget analysis in Stage 2 becomes the evidence base for a legislative briefer in Stage 3, which becomes a monitoring framework in Stage 5.

This is why the guidebook follows the governance cycle rather than listing AI features. Your work lives inside this cycle. So does AI's contribution.

1.5 Who This Guidebook Is For

This guidebook serves **every person who works in or with the Bangsamoro government**. That includes staff at all levels — from the administrative aide who formats memoranda to the minister who approves policy. It includes Members of Parliament, committee secretariat staff, budget officers, planners, researchers, program managers, and IT personnel. It includes consultants and development partners who support BARMM institutions from outside.

AI is not a specialist tool reserved for the Bangsamoro Information and Communications Technology Office (BICTO). AI is a **general productivity tool** that applies wherever someone reads, writes, analyzes, or decides. If your job involves documents — and in government, every job involves documents — AI can help.

But different roles need different chapters. Use this table to find your starting point.

Your Role and Where to Start

Your Role	Start Here	Then Read	Key Appendices
Administrative aide or clerk	Ch 2 — AI Literacy, Ch 3 — Workflow	Ch 8 — Implementation	App A (Prompt Library), App B (Tool Setup)
Research or policy analyst	Ch 2 — AI Literacy, Ch 4 — Knowledge Base	Ch 7 — Legislative Work, Ch 9 — M&E	App E (CSW + AI), App F (Legislative Briefer)
Budget officer	Ch 2 — AI Literacy, Ch 6 — Budgeting	Ch 9 — M&E, Ch 10 — Oversight	App G (Budget Briefer), App A (Prompt Library)
Legislative staff or committee secretary	Ch 2 — AI Literacy, Ch 7 — Legislative Work	Ch 11 — Codification, Ch 4 — Knowledge Base	App F (Legislative Briefer), App E (CSW + AI)
Program or project manager	Ch 2 — AI Literacy, Ch 8 — Implementation	Ch 5 — Planning, Ch 9 — M&E	App H (90-Day Plan), App A (Prompt Library)
Division chief or director	Ch 1 — Why AI, Ch 3 — Workflow	Ch 13 — Roadmap, Ch 14 — Training	

Your Role	Start Here	Then Read	Key Appendices
			App C (Readiness Assessment), App D (AI Policy)
Minister, MP, or senior executive	Ch 1 — Why AI, Ch 12 — Ethics	Ch 13 — Roadmap, Ch 15 — Future	App C (Readiness Assessment), App D (AI Policy)
IT officer or BICTO staff	Ch 4 — Knowledge Base, Ch 13 — Roadmap	Ch 14 — Training, Ch 12 — Ethics	App B (Tool Setup), App J (Legal Framework)

Notice the pattern. **Everyone starts with Chapter 2 (AI Literacy) or Chapter 1 (Why AI).** Operational staff then move to the governance-function chapter that matches their work. Leaders and managers move to the strategy, ethics, and implementation chapters. Appendices provide the templates, prompts, and checklists for daily use.

1.6 How to Use This Guidebook

You have two paths through this guidebook. Choose the one that matches how you learn best and what you need right now.

Path 1 — Sequential Reading

Start at Chapter 1. Work through to Chapter 15. This path builds your AI literacy from the ground up in Part I (Chapters 1-4), applies it to every governance function in Part II (Chapters 5-11), and addresses ethics, implementation, and the future in Part III (Chapters 12-15).

This path is best for: - First-time AI users who want a complete foundation - Division chiefs or managers planning an AI rollout for their office - Training facilitators designing an AI capacity-building program - Anyone who wants the full picture before diving into specifics

Path 2 — Chapter-Pick Reading

Go directly to the chapter that matches your current task. Need to draft a budget briefer? Start with Chapter 6. Preparing for interpellation? Start with Chapter 7. Planning an AI adoption roadmap for your ministry? Start with Chapter 13.

This path is best for: - Experienced AI users who want to deepen their skills in a specific governance area - Staff facing an immediate deadline who need practical guidance now - Supervisors who want to recommend specific chapters to their team members

Each chapter is self-contained. Cross-references point you to related chapters when you need deeper context. If a chapter mentions the Four-Step AI Workflow from Chapter 3, it includes a brief recap so you do not need to stop and read Chapter 3 first.

Conventions Used in This Guidebook

Throughout the guidebook, you will encounter these recurring elements:

Bold terms mark concepts, tools, or principles you should remember. When you see a bolded phrase, it carries weight in the framework.

Prompt examples appear in boxed sections showing exactly what to type into an AI tool. They use real BARMM documents and scenarios.

Case studies demonstrate AI applications using actual governance work — real BAAs, real budget documents, real parliamentary proceedings. Names and details are used with permission or drawn from public records.

"Try This" exercises give you a hands-on task to practice the techniques described. They are designed for immediate use with whatever AI tool you have access to.

Footnotes follow the Philippine Manual of Legal Citations (Feliciano 10th Edition) format for legal references, and standard academic citation format for other sources.[^23]

Cross-references link to related chapters and appendices. They look like this: *See Chapter 7, Section 7.3 for AI-assisted bill drafting.*

What You Need to Get Started

You need three things to use this guidebook:

1. **A computer or smartphone with internet access.** AI tools work through web browsers. No special software installation is required for the basic tools covered here.
2. **A willingness to experiment.** AI prompting is a skill. You get better by trying, failing, adjusting, and trying again. Chapter 2 walks you through your first government prompt.
3. **Your existing expertise.** AI amplifies what you already know. The more you understand your governance function, the better your AI outputs will be. A budget officer who knows the BAA No. 84 framework will get dramatically better AI-assisted budget analysis than someone who does not.[^18]

You do not need coding skills. You do not need a degree in computer science. You do not need anyone's permission to start. Open a browser, go to an AI tool, and begin.

Chapter Summary

This chapter established five foundations for the rest of the guidebook:

1. **The gap.** The BDP covers science and technology infrastructure but says nothing about AI for daily governance work. This guidebook fills that gap.
2. **The honest assessment.** AI drafts, synthesizes, cross-references, and structures. It does not decide, guarantee accuracy, understand local context, or take responsibility.
3. **Where BARMM stands.** Sixteen executive units, 89 BAAs, 570+ resolutions, 50,467 authorized positions, and an active governance cycle already in motion.
4. **The governance cycle.** Planning, budgeting, approval, implementation, M&E, oversight, and legislation — seven stages that form this guidebook's organizing structure.
5. **How to read.** Sequential for the full foundation. Chapter-pick for immediate needs. The role-based table tells you where to start.

Turn to Chapter 2 to build your AI literacy from the ground up — or jump directly to the governance-function chapter that matches your current work.

Notes

[^1]: The BTA was inaugurated on March 29, 2019. BAA No. 13 (Bangsamoro Administrative Code) was enacted on October 28, 2020, establishing the organizational structure. By March 2025, the Parliament had enacted 89 BAAs and filed over 748 resolutions with 260+ approved. *See* 2nd Bangsamoro Development Plan 2023-2028, Chapter 5: Improving and Strengthening Governance.

[^2]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 8: Harnessing Technology and Innovations to Increase Socioeconomic Opportunities and Improve Government Services.

[^4]: *Id.* (discussing BASE Scholarship and Regional Science and Technology Scholarship Program under Strategy 1).

[^5]: *Id.* (discussing Strategy 2, Program 6: Bangsamoro S&T Park / Technology Business Incubator).

[^6]: *Id.* (discussing Strategy 2, Program 7: BARMM Metrology Laboratory Program).

[^8]: *Id.* (listing 10 Priority Challenges for 2023-2028, including "Low appreciation on the role of science, technology, and innovation in national development" and "Inadequate and outdated STI infrastructure/facilities").

[^9]: Republic Act No. 11054, "An Act Providing for the Organic Law for the Bangsamoro Autonomous Region in Muslim Mindanao" (July 27, 2018). Article IX (Basic Rights) contains education-related provisions; Article X establishes the Bangsamoro Justice System.

[^10]: As of March 2025, the BTA Parliament has enacted 89 BAAs. *See* official Parliament records at parliament.bangsamoro.gov.ph.

[^11]: Republic Act No. 11054, Art. VII, Sec. 1 (establishing the parliamentary form of government for the Bangsamoro Autonomous Region).

[^12]: BAA No. 13 (Bangsamoro Administrative Code), enacted October 28, 2020, establishing 15 line ministries and the Office of the Chief Minister.

[^13]: *Id.* Title XVI (establishing commissions and attached agencies under the Office of the Chief Minister). The 10 OCM-attached agencies include: BPDA, BBOI, BIO, BICTO, OSC, OOBC, BPA, DAB, BDI, and CSEA.

[^14]: *Id.* Title XVI (Bangsamoro Commissions: BWC, BYC, BSC, BCPCH) and Title XVII (Independent Bodies: BHRC, BIAB).

[^15]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 5 (reporting 50,467 authorized positions with 35,812 filled as of November 2022, representing a 70.97% fill rate).

[^16]: *Id.* (reporting 260 resolutions approved out of 748 filed, and 31 bills approved out of 184 filed as of the reporting period). The 89 BAAs figure reflects the cumulative count through March 2025.

[^17]: BAA No. 13 (Bangsamoro Administrative Code), enacted October 28, 2020; BAA No. 17 (Bangsamoro Civil Service Code), enacted February 2021; BAA No. 18 (Bangsamoro Education Code), enacted May 2021.

[^18]: BAA No. 84 (Bangsamoro Budget System Act), establishing the fiscal framework for budget preparation, authorization, execution, and accountability in BARMM.

[^19]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 5 (identifying 7 priority codes mandated by BOL Art. XVI, Sec. 4). As of 2022, 3 of 7 were enacted: Administrative Code (BAA 13), Civil Service Code (BAA 17), and Education Code (BAA 18). The Electoral Code was subsequently enacted as BAA 35 in 2023, bringing the total to 4 of 7. Still pending: Revenue Code, Local Government Code, and Investment Code.

[^20]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 4: Development Framework (setting macroeconomic targets including 8-9% annual average GRDP growth rate against a 7.5% baseline).

[^21]: *Id.* (setting poverty incidence target of 20-25% by 2028 against a 29.80% baseline in 2021).

[^22]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 5 (reporting 6 of 8 IGR mechanisms fully operationalized, including the Intergovernmental Relations Body and the Philippine Congress-Bangsamoro Parliament Forum convened November 2022).

[^23]: The Philippine Manual of Legal Citations, 10th Edition (Feliciano), is the standard citation format for Philippine legal documents. This guidebook follows its conventions for all references to Republic Acts, Bangsamoro Autonomy Acts, resolutions, and other legislative materials.

02

AI Literacy for Government Staff

You do not need a computer science degree to use AI. You need the same skill you already use every day: the ability to give clear instructions and evaluate what comes back. This chapter strips AI down to plain language, shows you exactly how these tools work, and walks you through your first government prompt. By the end, you will understand what AI can do, what it cannot do, and how to talk about it with confidence.

2.1 What Is AI, in Plain Language

Artificial intelligence is software that finds patterns in massive amounts of text and uses those patterns to generate new text. That is it. No magic, no consciousness, no thinking — just pattern matching at an enormous scale.

The specific type of AI you will use in government work is called a **large language model**, or LLM. An LLM is trained by reading billions of pages of text — books, articles, laws, reports, websites, and documents from every field. During training, the software learns which words tend to follow other words. It learns that "Bangsamoro Autonomous Region in Muslim Mindanao" is a real phrase. It learns that budget documents have specific structures. It learns that legal provisions follow particular patterns.

Think of an LLM as a pattern machine. It does not understand meaning the way you do. It predicts what text should come next based on patterns it learned during training.

Here is an analogy. You have a colleague who has read every government document ever produced in the Philippines. Every BAA, every Republic Act, every policy paper, every memorandum. This colleague has a perfect memory for phrases and structures. If you ask them to "draft a memorandum requesting budget realignment," they can produce something that looks exactly right — because they have seen thousands of similar documents.

But this colleague has a limitation. They do not actually understand budget policy. They cannot tell you whether a realignment is legal under BAA 84.[^1] They can produce text that *looks* correct, but you must verify whether it *is* correct. They are a drafting machine, not a policy expert.

That is what an LLM is. A very fast, very well-read drafting machine that needs a human expert — you — to verify its output.

What Makes LLMs Different from Search Engines

A **search engine** finds existing documents that match your query. You type "BAA 13 Section 3," and Google shows you pages that contain those words.

An **LLM** generates new text based on your instructions. You type "Summarize the key principles in BAA 13 Section 3 as bullet points," and the AI writes a summary that did not exist before. The summary is not copied from a single source. It is assembled from patterns the AI learned during training.

This distinction matters. Search gives you what already exists. AI gives you something new — which means it can also give you something wrong. Every AI output requires human verification.

Why "Artificial Intelligence" Is a Misleading Name

The word "intelligence" suggests thinking. LLMs do not think. They calculate probabilities. When you ask an AI to "explain the Bangsamoro Organic Law," it is not reasoning about constitutional law. It is predicting which sequence of words is most likely to follow that instruction, based on millions of documents it processed during training.

The practical consequence: **AI can produce confident-sounding text that is completely wrong.** It has no way to distinguish between true statements and plausible-sounding fabrications. Only you can do that.

2.2 How AI Reads, Writes, and Reasons

Understanding three concepts will make you a better AI user than 90% of people who use these tools daily.

2.2.1 Input and Output

Every AI interaction follows one pattern: **you provide input, and the AI returns output.**

Input is everything you give the AI before it generates a response: - Your written instruction (called a **prompt**) - Any documents you paste or upload - Previous messages in the same conversation

Output is whatever the AI generates in response: - A drafted document - A summary of a long report - A table comparing two pieces of legislation - An answer to a question

Government analogy: Input is the assignment memo you give to a staff member — the task description, the background documents, the deadline, the format requirements. Output is the draft they hand back. The clearer your assignment memo, the better the draft. The same is true for AI.

2.2.2 Context Windows: The AI's Desk Space

Every AI tool has a **context window** — a maximum amount of text it can hold in a single conversation. Think of the context window as the AI's desk space.

A small desk holds one short document. A large desk holds dozens of files spread out side by side. When the desk is full, new documents push old ones off the edge. The AI can only work with what fits on its desk at that moment.

Practical numbers as of 2026:

AI Tool	Context Window	Rough Equivalent
ChatGPT (free tier)	~8,000 tokens	~15 pages of text
Claude (standard)	~200,000 tokens	~400 pages of text
Claude (extended)	~1,000,000 tokens	~2,000 pages of text
Gemini (standard)	~128,000 tokens	~250 pages of text

A **token** is roughly three-quarters of a word. The phrase "Bangsamoro Autonomous Region in Muslim Mindanao" is about 8 tokens.

What this means for your work:

- If you paste a 50-page bill into an AI tool with a small context window, the AI might lose track of early sections by the time it reaches the end.
- If you are working with a large context window, you can paste the full text of BAA 13 (the Bangsamoro Administrative Code) alongside three other BAAs and ask the AI to compare them.
- When a conversation gets very long, the AI may "forget" instructions you gave at the beginning. Start a new conversation when this happens.

Government analogy: The context window is like the physical desk of a government employee. A provincial office clerk with a small desk can only work on one file at a time. A legislative analyst with a large conference table can spread out multiple bills, committee reports, and reference documents simultaneously. The more desk space, the more the worker can cross-reference.

How Context Windows Affect Your BARMM Work

Here are practical scenarios showing why context window size matters:

Scenario A — Small context window (15 pages). You paste Section 3 of BAA 13 and ask the AI to explain each principle. This works. The text fits easily on the desk.

Scenario B — Medium context window (250 pages). You paste the full text of BAA 49 (Bangsamoro Local Governance Code), BAA 13 (Bangsamoro Administrative Code), and the relevant BOL articles. You ask the AI to identify where the two codes overlap or contradict each other. This works because all three documents fit on the desk simultaneously.

Scenario C — Large context window (2,000 pages). You paste fifteen BAAs covering health infrastructure (BAAs 21, 25-30, 73-74, 76, 78-80), the BDP health chapter, and the MOH organizational structure.[^1] You ask the AI to map every hospital upgrade authorized by law, its province, its bed capacity, and its current Level designation. This works because the entire reference set fits on the desk.

Scenario D — Overloaded. You try to paste all 89 BAAs into a tool with a 15-page context window. The tool cannot hold them. It either rejects the input, silently drops the older content, or processes only the last few pages. The output will be incomplete and unreliable.

The practical rule: Before you paste documents into an AI tool, estimate the total page count. Match it to the tool's capacity. If the documents do not fit, narrow your selection to the most relevant sections.

2.2.3 Hallucinations: When AI Makes Things Up

Hallucination is the technical term for when an AI generates information that sounds correct but is fabricated. This is the single most dangerous behavior of AI tools for government work.

Examples of AI hallucinations in a BARMM context:

- The AI cites "BAA 91, Section 14" — but only 89 BAAs have been enacted.[^2]
- The AI names a "Deputy Minister Rashid Adiong of MFBM" — but that person does not hold that position.[^3]
- The AI quotes "Article XII, Section 5 of the BOL" and provides text that looks real but does not match the actual provision.
- The AI states that a specific budget allocation "amounted to PHP 2.3 billion" with no source — and the real figure is different.

Why does this happen? The AI does not access a database of facts. It predicts plausible text. If the pattern of "BAA [number], Section [number]" appears frequently in its training data, it will generate new combinations that fit the pattern — even if those combinations do not correspond to real laws.

The rule: Treat every AI output the way you treat an unverified intelligence report. It might be accurate. It might be partially accurate. It might be entirely fabricated. You verify before you use it.

Three verification habits that prevent hallucination damage:

1. **Cross-check every citation.** If the AI cites a BAA, open the actual BAA text and confirm the section exists and says what the AI claims.
2. **Verify every name and title.** If the AI mentions an official, check the current BARMM officials directory.[^3]
3. **Question confident specifics.** When the AI provides exact numbers, dates, or budget figures without you providing a source, treat those as suspect until verified.

2.3 Types of AI Tools for Government Work

AI is not a single tool. It is a category of tools, each suited to different tasks. This section maps the four categories most relevant to BARMM government operations.

AI Tool Categories for BARMM Government Work

Category	What It Does	Government Application	Example Tools (2026)
Text Generation	Writes new text based on instructions	Drafting memoranda, legislative briefers, policy papers, correspondence	Claude, ChatGPT, Gemini
Document Analysis	Reads and summarizes long documents	Reviewing proposed bills, comparing BAA provisions, extracting key points from BDP chapters	Claude, NotebookLM, ChatGPT
Research Synthesis	Combines information from multiple sources into structured findings	Legislative research, policy comparison across jurisdictions, preparing background papers for committee hearings	NotebookLM, Gemini Deep Research, Claude
Translation	Converts text between languages	English-to-Filipino correspondence, Filipino-to-English reports, Arabic protocol greetings	Claude, Google Translate, ChatGPT

2.3.1 Text Generation

Text generation is the most common AI use case for government staff. You describe what you need, and the AI writes a first draft.

BARMM examples:

- **Routine correspondence.** "Draft a transmittal letter from the Office of the Chief Minister to the Speaker of the Parliament, forwarding the proposed budget for FY 2027 for parliamentary consideration."
- **Meeting summaries.** Paste raw meeting notes and ask the AI to organize them into a structured summary with action items, responsible offices, and deadlines.
- **First-draft memoranda.** "Draft a memorandum from MFBM to all ministry budget officers, reminding them of the FY 2027 budget submission deadline and listing the required attachments per BAA 84."[^1]
- **Speech preparation.** "Prepare a 5-minute opening statement for a committee hearing on the proposed education amendments, highlighting three key issues."

What text generation does well: Produces structured documents quickly, follows templates, maintains consistent tone and formatting, and handles high-volume drafting tasks.

What text generation does poorly: Verifying facts, making policy judgments, understanding local political context, and knowing which information is current versus outdated.

Time savings: A routine transmittal letter that takes 30 minutes to draft manually takes 3 minutes with AI — plus 5 minutes for your review and corrections. A first-draft legislative briefer that takes a full day drops to 2-3 hours. The time savings come from drafting speed, not from skipping review.

2.3.2 Document Analysis

Document analysis is the second most valuable AI capability for government operations. You give the AI a document — or several documents — and ask it to extract, compare, or summarize information.

BARMM examples:

- **Bill review.** Upload a proposed bill and ask: "Identify every section that creates a new government body. For each body, list its name, composition, and functions."
- **Legal comparison.** Paste two versions of an amendment and ask: "List every difference between Version A and Version B, organized by section number."
- **Budget analysis.** Upload the GAA and ask: "Create a table showing the appropriation for each ministry, sorted from highest to lowest."

- **Provision extraction.** Paste BAA 13 Section 3 and ask: "List each declared principle and policy as a separate bullet point, with a one-sentence explanation in plain language."

Why this matters for BARMM: The Bangsamoro Transition Authority has enacted 89 BAAs, many of which cross-reference and amend each other.[^2] BAA 14 amends BAA 3. BAA 33 amends BAA 23. BAA 37 amends BAA 13. BAA 70 amends BAA 54. BAA 77 amends BAA 58. Manually tracking these amendment chains across hundreds of pages is time-consuming and error-prone. AI can scan multiple documents simultaneously and flag connections a human reader might miss.

Practical tip: When analyzing a bill or BAA, always paste the **full text** of the document, not just the section you are interested in. AI performs better when it can see the complete structure — definitions, scope, implementing provisions, and repealing clauses — rather than a fragment.

2.3.3 Research Synthesis

Research synthesis goes beyond single-document analysis. It combines findings from multiple sources into a coherent summary with citations.

BARMM examples:

- **Committee hearing preparation.** Load the proposed bill, relevant existing BAAs, the BOL provisions on the subject, and the BDP chapter on the sector. Ask the AI to produce a briefing paper that maps the proposal against existing law and development goals.
- **Cross-jurisdictional comparison.** Ask the AI to compare how BARMM, ARMM, and the Cordillera Administrative Region handle a specific governance issue.
- **Development tracking.** Load multiple quarterly reports and ask the AI to identify trends, gaps, and progress against BDP 2023-2028 targets.[^4]

Key limitation: Research synthesis is only as good as the sources you provide. If you give the AI incomplete documents, its synthesis will have gaps. If you give it outdated documents, its findings will be outdated. **The AI does not know what it does not have.** You must ensure the source documents are complete and current.

A tool worth knowing: NotebookLM. Google's NotebookLM is a free research synthesis tool that excels when you have specific source documents and need the AI to stay strictly within those sources.[^8] You upload your PDFs, and NotebookLM only draws from what you uploaded — reducing hallucination risk. For BARMM staff preparing committee hearing briefers, this means uploading the proposed bill, the relevant BAAs, and

the BOL chapters, then asking NotebookLM to synthesize findings. The outputs still need human review, but the source-grounded approach produces more reliable first drafts than general-purpose AI tools.

2.3.4 Translation

Translation serves a practical need across BARMM, where government operations use English, Filipino, and Arabic.

BARMM examples:

- **Official correspondence.** Translate a Filipino memorandum into English for national agency submission, or translate English committee reports into Filipino for broader distribution.
- **Islamic greetings and protocols.** Generate proper Arabic greetings for official documents, with transliteration and English translation.
- **Public communications.** Translate policy announcements from English into Filipino to reach a wider audience.

Limitations: AI translation handles standard Filipino and English well. It struggles with regional languages (Tausug, Maguindanaon, Maranao), colloquial expressions, and specialized Islamic legal terminology. For sensitive translations involving Shari'ah concepts or indigenous people's rights, always have a qualified human translator review the AI output.

2.4 The Prompt as a Government Instruction

A **prompt** is the instruction you type into an AI tool. Prompting is not a technical skill. It is the same skill you use when you write an assignment memo, a terms of reference, or a CSW tasking order.

Government analogy: A prompt is an assignment memo for AI.

Compare these two assignment memos:

Vague memo (bad):

> "Please prepare something about the budget."

Clear memo (good):

> "Prepare a 3-page summary of BAA 85 (GAA FY 2026) showing the total appropriation per ministry. Present the data in a table sorted from highest to lowest allocation. Include a paragraph comparing the top 3 ministries' allocations to FY 2025 levels. Submit by Friday. The audience is the Committee on Appropriations."

The second memo produces better work because it specifies **what** to produce, **how** to format it, **who** the audience is, and **what** scope to cover. AI prompts work exactly the same way.

The Five Elements of a Good Government Prompt

Every effective prompt contains most or all of these five elements:

Element	What It Does	Example
Role	Tells the AI what perspective to adopt	"You are a legislative analyst for the Bangsamoro Parliament"
Task	Describes exactly what you need	"Summarize the key provisions of this bill"
Format		

Element	What It Does	Example
	Specifies the output structure	"Present as numbered bullet points, one per section"
Context	Provides background information	"This bill amends BAA 49 (Bangsamoro Local Governance Code)"
Constraints	Sets boundaries on what the AI should not do	"Do not add information beyond what is in the bill text. Mark any gaps as [INFORMATION NEEDED]"

You do not need all five elements for every prompt. A simple request — "Summarize this document in 10 bullet points" — only needs Task and Format. But complex government tasks benefit from all five.

Common Government Tasks Mapped to Prompt Elements

Government Task	Key Prompt Elements	Example Prompt Opening
Draft a transmittal letter	Role + Task + Format	"You are an executive assistant in the Office of the Chief Minister. Draft a transmittal letter..."
Summarize a proposed bill	Task + Format + Constraints	"Summarize this proposed bill in 10 bullet points. One bullet per section. Do not add analysis..."
Compare two BAA versions	Task + Context + Format	"I am providing two versions of an amendment to BAA 49. Create a comparison table showing every difference..."
Prepare talking points	Role + Task + Context + Format	"You are a legislative staff member preparing the committee chair for a hearing on PB 312. Draft 5 talking points..."
Simplify legal text	Role + Task + Constraints	"You are a government trainer. Rewrite this BOL provision in plain language a high school graduate can

Government Task	Key Prompt Elements	Example Prompt Opening
		understand. Do not change the legal meaning."

The Iterative Prompting Method

One prompt rarely produces a perfect output. Experienced AI users follow an iterative method:

1. **First prompt:** Give the AI the task with your source documents. Accept that the first output will be 60-70% of what you need.
2. **Second prompt:** Point out specific problems. "The third bullet point is wrong — BAA 49 does not cover barangay elections. Correct this." Specific feedback produces better revisions than vague feedback like "make it better."
3. **Third prompt:** Request final formatting adjustments. "Add the section numbers in parentheses after each bullet. Change the heading to match our standard memo format."

This iterative approach mirrors how you already work with staff. You assign a task, review the draft, provide corrections, and receive a revised version. The difference is speed: each AI revision cycle takes seconds, not days.

Before and After: A BOL Provision Example

Suppose you need to explain Article V, Section 2 of the Bangsamoro Organic Law to a non-lawyer colleague. Here is the actual BOL text:

> **Section 2.** *Powers of Government.* — The Bangsamoro Government shall have the authority to exercise its powers over its internal affairs and territorial jurisdiction as provided in this Organic Law. The Bangsamoro Government shall have the power to create its own sources of revenue and to levy taxes, fees, and charges that shall accrue exclusively to the Bangsamoro Government, in accordance with this Organic Law.[^5]

Before (weak prompt):

> "Explain this section."

AI output from weak prompt:

> "This section provides that the Bangsamoro Government has authority over internal affairs and territorial jurisdiction as established by the Organic Law. It also has the power to create revenue sources and levy taxes."

This output is technically accurate but useless — it restates the provision without simplifying it.

After (strong prompt):

> "You are a government trainer explaining the BOL to new BARMM employees who have no legal background. Rewrite this provision in plain Filipino-English (Taglish), using a concrete example. Maximum 5 sentences. Do not change the legal meaning."

AI output from strong prompt:

> "Ang BARMM ay may sariling kapangyarihang mamahala sa loob ng kanyang teritoryo — hindi na kailangan humingi ng permission sa national government para sa internal affairs. Kasama rito ang power na gumawa ng sariling sources of revenue. For example, the Bangsamoro Parliament can pass a law creating a regional business tax na mapupunta directly sa BARMM coffers, hindi sa national treasury. This is different from ordinary regions na umaasa lang sa IRA o national tax share. The legal basis is the BOL itself — Republic Act 11054."

The strong prompt produced a practical explanation with a concrete example. The difference was not AI capability — it was prompt quality.

2.5 Hands-On: Your First Government Prompt

This section walks you through a real exercise. You will use AI to summarize BAA 13, Section 3 — the Declaration of Principles and Policies of the Bangsamoro Administrative Code.[^6]

What You Need

- Access to any AI text tool (Claude, ChatGPT, or Gemini — all will work)
- The text of BAA 13, Section 3 (provided below)
- 10 minutes

The Source Text

BAA 13, Section 3 declares eleven principles and policies that serve as the foundation of the Bangsamoro Administrative Code. The full text reads:

> **Sec. 3. Declaration of Principles and Policies.** — The Bangsamoro Government hereby declares the following principles and policies as the basic foundation of the Code:
>
> a. The Bangsamoro Autonomous Region in Muslim Mindanao is an autonomous regional government with asymmetrical relationship with the Republic of the Philippines and shall be parliamentary in form. Its political system is democratic, and all government authority resides in the people...
>
> b. The Bangsamoro Government recognizes and protects the customs and traditions, beliefs, and cultures of its indigenous inhabitants...
>
> c. The Bangsamoro Government recognizes the vital role of women and youth, and the valuable contributions of differently abled persons in nation-building...
>
> d. The Bangsamoro Government shall ensure every citizen in its territorial jurisdiction the provision of the basic necessities and equal opportunities in life...
>
> e. The Bangsamoro Government shall promote unity, peace, justice, and goodwill among all peoples...
>
> f. The Bangsamoro Government, its offices, agencies, including GOCCs shall ensure full respect for human rights...
>
> g. The Bangsamoro Government shall ensure the autonomy of its constituent local government units (LGUs)...
>
> h. The Bangsamoro Government shall develop a self-reliant and independent regional economy...
>
> i. The Bangsamoro Government shall encourage the participation of non-governmental, community-based, and sectoral organizations in government affairs...
>
> j. The Bangsamoro Government, in pursuit of moral governance, shall maintain honesty, integrity, transparency and accountability...
>
> k. Subject to reasonable conditions prescribed by law, the Bangsamoro Government adopts and implements a policy of full public disclosure of all its transactions involving public interest.

(The full verbatim text of each principle is in the enacted BAA 13. The above excerpts show the opening clause of each.)

Step-by-Step Walkthrough

Step 1: Open your AI tool.

Open Claude (claude.ai), ChatGPT (chat.openai.com), or Gemini (gemini.google.com) in your browser. Create a new conversation.

Step 2: Paste the source text.

Copy the full text of BAA 13, Section 3 from your reference copy. Paste it into the chat. (If you have the full BAA 13 document, paste the entire Section 3 — all eleven principles with their complete text.)

Step 3: Write your prompt.

Type the following prompt after the pasted text:

```
You are a BARMM government trainer preparing a handout for new employees.

Task: Summarize each of the 11 principles in BAA 13, Section 3
in one sentence of plain language. No legal jargon.

Format:
- Numbered list (1–11)
- Each item: [Letter] — [One-sentence plain language summary]
- Add a short label for each principle (e.g., "Democratic Governance",
  "Indigenous Peoples' Rights")

Constraints:
- Do not add principles that are not in the source text
- Do not change the legal meaning
- Use language a high school graduate can understand
```

Step 4: Review the output.

The AI will generate something like this:

> 1. **(a) Democratic Governance** — BARMM is a self-governing region within the Philippines, with a parliamentary system where power comes from the people.
> 2. **(b) Indigenous Peoples' Rights** — The government protects the customs, traditions, and cultures of indigenous communities and shields them from discrimination.
> 3. **(c) Women, Youth, and PWD Participation** — Women, youth, and persons with disabilities play vital roles in building the region and the government supports their well-being.
> 4. **(d) Social Justice** — Every citizen deserves basic necessities and equal opportunities, with social justice applied across all aspects of life.
> 5. **(e) Peace and Unity** — The government promotes peace, justice, and goodwill, and supports the peaceful resolution of disputes.
> 6. **(f) Human Rights** — All government offices, agencies, and GOCCs must respect human rights in every plan, program, and activity they carry out.
> 7. **(g) Local Government Autonomy** — Provinces, cities, municipalities, and barangays keep their autonomy, and their existing privileges under the Local Government Code are not reduced.
> 8. **(h) Economic Self-Reliance** — The government develops a regional economy that is self-reliant and serves the needs of the Bangsamoro people.
> 9. **(i) Civil Society Participation** — NGOs, community organizations, and sectoral groups are encouraged to participate in government affairs.
> 10. **(j) Moral Governance** — The government commits to honesty, integrity, transparency, accountability, and active measures against corruption.
> 11. **(k) Full Public Disclosure** — All government transactions involving public interest are subject to full public disclosure.

Step 5: Verify the output.

Go through each summary and check it against the original text:

- Does summary (a) accurately capture the "asymmetrical relationship" concept? If the AI omitted this detail, you can ask it to add it.
- Does summary (g) correctly state that LGU privileges "shall not be diminished"? If the AI softened this language, you can request a correction.
- Did the AI add a 12th principle that does not exist in the source? If yes, delete it.

Step 6: Refine.

Give the AI specific feedback:

```
Good draft. Two corrections:
1. Item (a) should mention the "asymmetrical relationship" with the
   national government — this is a defining feature of BARMM.
2. Item (g) should explicitly state that privileges under RA 7160
   "shall not be diminished" — this is stronger than "are not reduced."

Please revise only these two items.
```

The AI will revise only those items and keep the rest unchanged.

What You Just Learned

In 10 minutes, you:

1. **Prepared context** by gathering the source text
2. **Wrote a clear prompt** using Role, Task, Format, and Constraints
3. **Reviewed the output** against the source document
4. **Refined with specific feedback** instead of starting over

This is the same four-step cycle used for every AI task in government — from simple summaries to complex legislative briefers. The complexity of the prompt changes. The process does not.

Variations to Try

Once you complete the basic exercise, try these variations to build your prompting skills:

Variation 1 — Different audience. Change the Role line to: “You are a barangay captain explaining BARMM governance to community members.” Notice how the AI adjusts its language and examples.

Variation 2 — Different format. Change the Format to: “Create a two-column table. Column 1: Principle letter and label. Column 2: Plain language explanation in one sentence.” Notice how format instructions change the output structure.

Variation 3 — Comparative analysis. Paste BAA 13, Section 3 alongside Article II, Section 1 of the 1987 Philippine Constitution (Declaration of Principles and State Policies). Add this prompt: “Compare the BARMM principles in BAA 13, Section 3 with the national principles in Article II of the Constitution. Identify which BARMM principles mirror national principles and which are unique to the Bangsamoro.” This introduces multi-document analysis — a skill you will use frequently in legislative work.

Variation 4 — Translation. Take the AI's output from the basic exercise and add: "Translate this summary into Filipino. Keep the principle labels in English." This tests the AI's bilingual capability and shows you the translation quality you can expect.

Each variation takes 5 minutes. After completing all four, you will have practiced single-document analysis, format control, comparative analysis, and translation — the four most common AI tasks in government work.

Choosing the Right Tool for the Task

You now know four AI tool categories. The question is: which one should you use for a given task? Here is a decision guide:

Use Text Generation when: - You need a first draft of a document (memo, letter, briefer, speech) - You have a clear template or format in mind - The task is primarily about writing, not analysis

Use Document Analysis when: - You have a long document and need specific information extracted - You need to identify patterns, gaps, or inconsistencies in a single document - You want to convert unstructured text into a structured format (tables, bullet lists)

Use Research Synthesis when: - You need to combine findings from multiple documents - You are preparing background research for a committee hearing or policy decision - You need to compare provisions across different laws or BAAs

Use Translation when: - You need to convert between English, Filipino, or Arabic - You want to produce bilingual versions of official documents - You need to simplify technical language into accessible explanations

Many tasks combine categories. A legislative briefer, for example, requires document analysis (reading the proposed bill), research synthesis (comparing it to existing law), and text generation (writing the briefer). You can do all three in a single AI conversation by working through each stage sequentially.

2.6 Common Misconceptions and How to Address Them

Every new technology carries misconceptions. AI has more than most because the name itself — "artificial intelligence" — implies capabilities the technology does not have. Here are the six most common misconceptions among government staff, what the reality actually is, and how to respond when colleagues raise them.

Misconceptions vs. Reality

#	Misconception	Reality	How to Respond
1	"AI understands what I mean"	AI predicts the next most probable word based on patterns. It does not understand meaning, context, or intent. It processes text — it does not comprehend it.	"AI is a pattern machine, not a thinking machine. It predicts words, like autocomplete on your phone — just far more sophisticated. We must still tell it exactly what we need."
2	"AI will replace government employees"	AI replaces *tasks*, not *people*. A legislative analyst who uses AI does not become unnecessary — they become faster. The analyst still makes judgments, verifies facts, and applies professional expertise the AI lacks. No AI can attend a committee hearing, build relationships with stakeholders, or navigate political realities.	"AI replaces the drafting, not the drafter. You still decide, verify, and sign. AI handles the typing. You handle the thinking."

#	Misconception	Reality	How to Respond
3	"AI output is always accurate"	AI regularly fabricates information — fake citations, wrong names, non-existent laws, and invented statistics. The technical term is **hallucination**. Every AI output must be verified against source documents before use in any official capacity.	"AI is like a very confident intern who never says 'I don't know.' Always check the output against the actual documents."
4	"Using AI is cheating"	AI is a tool, like a calculator or a word processor. A budget officer who uses a spreadsheet formula is not "cheating" at math. A legislative analyst who uses AI to draft a first version of a briefer is not "cheating" at analysis — they are working more efficiently. What matters is the quality and accuracy of the final product, not which tool produced the first draft.	"We do not say a carpenter is cheating because they use a power saw instead of a handsaw. AI is a power tool for knowledge work."
5	"AI is too complicated for me"	If you can write a clear assignment memo, you can use AI. Prompting requires the same skills as writing a CSW tasking order: state what you need, provide background documents, specify	"You write assignment memos every week. A prompt is the same thing — just addressed to software instead of a staff member."

#	Misconception	Reality	How to Respond
		the format, and set boundaries. You already practice these skills daily.	
6	"Whatever AI produces can be submitted as-is"	No AI output should go directly from the tool to a decision-maker without human review. AI drafts contain errors, uses generic language, misses BARMM-specific terminology (writing "DSWD" instead of "MSSD," "DepEd" instead of "MBHTE"), and may fabricate citations. [^7] The **Rule of Signature** applies: if your name goes on the document, you verified every line.	"Would you sign a letter written by a new staff member without reading it? Treat AI output the same way."
7	"I need to learn programming to use AI"	Text-based AI tools like Claude, ChatGPT, and Gemini work through natural language — plain English or Filipino. You type instructions in the same language you use for emails and memoranda. There is no code, no command line, and no technical syntax required.	"If you can type an email, you can use AI. You write instructions in plain language. The AI reads them and responds."
8	"AI has access to our internal files"	Standard AI tools (Claude, ChatGPT, Gemini) do not have access to your computer, your	"AI only sees what you show it. It cannot access iGovPhil, your email, or internal files. You

#	Misconception	Reality	How to Respond
		email, your internal databases, or any BARMM systems. They only process what you paste or upload into the conversation. They cannot search government servers or access classified information unless you provide it.	control what goes in."

A Note on Data Sensitivity

Misconception #8 deserves special attention. While AI tools do not access your internal files, the reverse is also true: **anything you paste into an AI tool leaves your computer.** When you paste the text of a draft bill into ChatGPT or Claude, that text is transmitted to external servers for processing.

What this means for BARMM staff:

- **Public documents** (enacted BAAs, published BOL text, official budget documents) can be safely pasted into AI tools. These are already public.
- **Draft documents** (unreleased bills, internal memoranda, pre-decisional policy papers) require caution. Check your office policy before pasting confidential drafts into external AI tools.
- **Personnel data** (employee records, performance evaluations, disciplinary actions) should never be pasted into external AI tools.
- **Security-sensitive information** (peace process negotiations, security assessments, intelligence reports) must never be processed through external AI tools.

When in doubt, ask: "Would I email this document to someone outside the Bangsamoro Government?" If the answer is no, do not paste it into an AI tool. Chapter 12 of this guidebook covers data governance and ethical considerations in full detail.

Addressing Misconceptions in the Workplace

When colleagues express these misconceptions, respond with the **concrete example method** rather than theoretical explanations:

- **Do not say:** "AI uses transformer architecture with attention mechanisms to predict token sequences." Nobody cares.
- **Do say:** "Let me show you. Give me a task you are working on right now. I will use AI to draft a first version in 3 minutes. Then you tell me what it got right and what it got wrong."

A live demonstration converts skeptics faster than any explanation. The most effective way to address misconceptions is to let colleagues watch AI produce useful output — and then watch you catch and correct its mistakes. Both parts matter. They see the speed. They also see that human review is non-negotiable.

The Three-Sentence Explanation

When a senior official or a colleague asks "What is AI?", use this three-sentence explanation:

> **"AI is software that reads massive amounts of text and learns patterns. When you give it instructions, it generates new text based on those patterns — like a very fast drafter who has read every document ever written. But it does not understand what it writes, so we always verify the output before using it."**

This explanation is accurate, jargon-free, and honest about the limitation. Memorize it. You will use it often.

Key Takeaways

1. **AI is a pattern machine.** Large language models predict text based on patterns learned from billions of pages. They do not understand, think, or reason. They generate plausible text.
2. **Context windows are desk space.** The more documents you can fit in the AI's context window, the better it can cross-reference and compare. But every tool has a limit.
3. **Hallucinations are real and dangerous.** AI fabricates citations, names, and statistics. Every output must be verified against source documents before use in any official document.
4. **Four tool categories serve government work.** Text generation, document analysis, research synthesis, and translation each serve different needs. Match the tool to the task.
5. **A prompt is an assignment memo.** The same skills you use to write clear CSW tasking orders — Role, Task, Format, Context, Constraints — produce effective AI prompts.
6. **Misconceptions block adoption.** Address them with live demonstrations, not lectures. Show colleagues what AI can do, then show them how you catch its mistakes.
7. **Data sensitivity requires judgment.** Public documents can be safely processed through AI tools. Draft documents, personnel data, and security-sensitive information require caution or should never be entered into external AI tools. When in doubt, apply the email test: if you would not email it outside the Bangsamoro Government, do not paste it into an AI tool.
8. **Start simple, build gradually.** Your first AI task should be a basic summary or document extraction — not a 13-section legislative briefer. Master the four-step cycle (Prepare, Prompt, Review, Refine) on simple tasks before applying it to complex ones.

The next chapter takes these foundations and puts them to work. You will learn a repeatable four-step workflow for using AI in any government task, directly connected to the ADDRESS IT framework for Complete Staff Work.

Footnotes

[^1]: Bangsamoro Autonomy Act No. 84, "Bangsamoro Budget System Act of 2025," establishes the legal framework for the BARMM budget cycle, including preparation, authorization, execution, and accountability. MFBM (Ministry of Finance, Budget, and Management) serves as the primary fiscal authority for the Bangsamoro Government.

[^2]: As of March 2026, the Bangsamoro Transition Authority Parliament has enacted 89 Bangsamoro Autonomy Acts (BAAs). BAA numbers cited in any document should be verified against the official BAA index maintained by the Bangsamoro Parliament Secretariat. See the BAA Quick-Reference Index in the reference materials of this guidebook.

[^3]: Official names and titles of BARMM officials should always be verified against current official directories. The BTA membership and ministerial appointments are updated periodically. A verified BARMM officials reference is maintained separately and should be consulted before finalizing any document that names government personnel.

[^4]: The 2nd Bangsamoro Development Plan (BDP) 2023-2028 establishes six development goals, eight strategies, and sector-specific targets for the Bangsamoro Autonomous Region. The BDP is the authoritative reference for development planning, program design, and budget alignment in BARMM.

[^5]: Republic Act No. 11054, "An Act Providing for the Organic Law for the Bangsamoro Autonomous Region in Muslim Mindanao," Article V, Section 2. The BOL's 18 Articles define the full powers, structure, and fiscal framework of the Bangsamoro Government.

[^6]: Bangsamoro Autonomy Act No. 13, "An Act Providing for the Bangsamoro Administrative Code and for Other Related Purposes," Section 3 (Declaration of Principles and Policies). BAA 13 serves as the comprehensive administrative code governing the structure, functions, and procedures of the Bangsamoro Government.

[^8]: Google NotebookLM is a free AI research tool that constrains its outputs to user-uploaded sources. Unlike general-purpose AI tools, NotebookLM does not draw on its broader training data when answering questions — it only references the specific documents in the user's notebook. This source-grounded approach significantly reduces hallucination risk for document-heavy government work. See Jeff Su, "NotebookLM Changed Completely: Here's What Matters (in 2026)," YouTube, March 2026.

[^7]: BARMM uses distinct ministry names that differ from their national government counterparts. Common errors include: writing “DSWD” instead of “MSSD” (Ministry of Social Services and Development), “DepEd” instead of “MBHTE” (Ministry of Basic, Higher, and Technical Education), “DOLE” instead of “MOLE” (Ministry of Labor and Employment), “DBM” instead of “MFBM” (Ministry of Finance, Budget, and Management), and “DOH” instead of “MOH” (Ministry of Health). AI tools trained primarily on national government documents frequently produce national agency names rather than BARMM ministry names. See the full ministry name mapping in Appendix C of this guidebook.

03

The AI-Augmented Workflow

You already know how to do government work. You analyze problems, research solutions, draft recommendations, and submit them for approval. AI does not change what you do. It changes how fast and how well you can do it.

This chapter gives you a repeatable workflow for using AI in any government task. It connects directly to the ADDRESS IT framework you may already use for Complete Staff Work.[^1] By the end of this chapter, you will know when to use AI, when not to, and how to verify everything it produces.

3.1 The Human-AI Partnership Model

The foundational principle of Complete Staff Work is this: **the decision-maker should only need to approve or disapprove**.[^2] The staff member does all the analysis, research, option development, and drafting. The principal makes the final call.

AI fits this model exactly. Think of AI as a very fast, very knowledgeable junior staff member. It drafts. You decide.

What AI does well:

- **Drafts documents** — first versions of briefers, memoranda, policy recommendations, and legislative text
- **Researches and synthesizes** — scans long documents, compares provisions across multiple BAAs, identifies relevant sections of the BOL
- **Organizes information** — structures raw data into tables, timelines, and formatted reports
- **Translates and paraphrases** — converts technical language into plain explanations, works across English, Filipino, and Arabic
- **Checks consistency** — finds contradictions between a draft bill and existing legislation

What AI does not do:

- **Make policy decisions** — AI has no authority, no mandate, and no accountability
- **Replace professional judgment** — it cannot weigh political realities, cultural sensitivities, or community relationships
- **Guarantee accuracy** — every AI output can contain errors, fabrications, or outdated information

- **Take responsibility** — your name goes on the document, not the AI's

The partnership works like this: **AI handles volume and speed. You handle judgment and accountability.** A policy analyst who uses AI can produce a legislative briefer in two hours instead of two days. But the analyst still reads every line, checks every citation, and signs the transmittal memo. The quality bar does not drop. The throughput rises.

> **The Rule of Signature**: If you would not sign a document without reading it, do not submit an AI-generated document without reviewing it. Your signature means you verified the content — regardless of who or what produced the first draft.

Three Levels of AI Partnership

The partnership operates differently depending on the complexity of the task:

Level 1 — AI as Drafter. You assign a well-defined task with a clear template. The AI produces a first draft. You review and finalize. This applies to routine correspondence, meeting summaries, and standard-format documents. Most government staff will start here.

Level 2 — AI as Research Assistant. You assign an open-ended research task. The AI scans multiple documents, identifies relevant provisions, and synthesizes findings. You evaluate the research, add your professional knowledge, and shape the conclusions. This applies to legislative briefers, policy analyses, and comparative studies.

Level 3 — AI as Thinking Partner. You discuss a complex problem with the AI, testing different framings and challenging your assumptions. The AI generates options, identifies blind spots, and pressure-tests your reasoning. You make all decisions. This applies to strategic planning, program design, and difficult policy trade-offs.

Most government work falls into Levels 1 and 2. Level 3 is where AI becomes most valuable for senior analysts and decision-support staff — but it requires more skill in prompting and a stronger ability to evaluate AI outputs critically.

3.2 The Four-Step AI Workflow for Government Tasks

Every AI-assisted task follows four steps. These are not theoretical. They mirror how the most effective AI practitioners work, whether drafting legislation or preparing budget proposals.[^3]

Step	What You Do	What AI Does	Time Saved
1. Prepare Context	Gather documents, define the task, set boundaries	Nothing yet — waiting for your input	0% (investment phase)
2. Prompt Clearly	Write clear instructions with examples	Generates first draft based on your guidance	60-80% of drafting time
3. Review Critically	Check facts, verify citations, assess quality	Nothing — this is your job	0% (quality gate)
4. Refine Iteratively	Give specific feedback, request changes	Revises based on your corrections	50-70% of revision time

Notice the pattern: Steps 1 and 3 are entirely human. Steps 2 and 4 are where AI contributes. **You frame the work and verify the output. AI does the heavy lifting in between.**

3.2.1 Step 1: Prepare Context (Gather Relevant Documents, Define the Task, Set Boundaries)

A prompt without context is like a CSW assignment without background materials. The AI will produce something — but it will be generic, possibly wrong, and definitely not tailored to BARMM.

Before you type a single prompt, gather these:

1. **The source documents.** If you are drafting a legislative briefer for a proposed bill, have the bill text ready. If you are preparing a budget analysis, have the BAA 84 provisions and the relevant Budget Call Memorandum.[^4]

2. **The legal framework.** Which provisions of the Bangsamoro Organic Law apply? Which existing BAAs are relevant? What national laws intersect?[^5]
3. **The audience and format.** Are you writing for a committee chair? A plenary session? A minister? The format and depth change depending on who will read it.
4. **The boundaries.** Tell the AI what it should *not* do. "Do not draft new provisions — only analyze existing ones." "Do not recommend policy changes — only summarize the current state." Clear boundaries prevent the AI from overstepping.

Practical example: You are asked to prepare a briefer on BAA 85 (Annual Budget for FY 2025). Before prompting the AI, you would gather: the full text of BAA 85, relevant sections of BAA 84 (Bangsamoro Budget System Act), the BDP 2023-2028 investment priorities, and the committee's specific questions. Paste or upload these documents into your AI tool before writing the prompt.

> **Time investment:** Context preparation takes 15-30 minutes for most tasks. Skip it and you will spend two hours fixing a bad output. This is the same "measure twice, cut once" logic that drives good CSW practice.

3.2.2 Step 2: Prompt Clearly (Write Clear Instructions — Like a Good CSW Assignment Memo)

A prompt is an instruction. Treat it like an assignment memo from a decision-maker to a staff member. The best assignment memos are specific, structured, and clear about what "done" looks like. The best prompts follow the same pattern.

The anatomy of a good government prompt:

```
[ROLE] You are a legislative analyst for the Bangsamoro Parliament.

[TASK] Draft a legislative briefer analyzing Proposed Bill No. 245
(Bangsamoro Revenue Code).

[FORMAT] Use the 13-section legislative briefer format from the
CSW Guidebook. Include sections I through XIII.

[SOURCES] Base your analysis on:
- The bill text (pasted below)
- BAA 84 (Bangsamoro Budget System Act)
- BOL Articles VII and XII on fiscal autonomy
- RA 11054 (Bangsamoro Organic Law), particularly the revenue provisions

[CONSTRAINTS]
- Do not fabricate committee proceedings that have not occurred
- Mark any claim you cannot verify with [UNVERIFIED]
- Use proper BARMM terminology (MFBM, not DBM; MILG, not DILG)

[QUALITY STANDARD] The briefer must be ready for supervisor review.
Write at the level of a senior analyst, not an intern summary.
```

Five rules for government prompts:

1. **Assign a role.** "You are a budget analyst for MFBM" produces better output than a generic request. The role activates the AI's relevant knowledge.
2. **Specify the format.** Name the exact document type. Reference templates if they exist. "Use the BB-coded budget briefer format" is better than "write me a budget analysis."
3. **Provide the source material.** Paste or upload the actual documents. Do not rely on the AI's memory of legislation — it may be outdated or incorrect.
4. **Set constraints explicitly.** Tell the AI what not to do. "Do not propose new institutional structures." "Do not include figures you cannot source."
5. **Define "done."** State what a successful output looks like. "The output should be 8-10 pages, suitable for a committee chair who has 30 minutes to read before session."

3.2.3 Step 3: Review Critically (Check Facts, Verify Citations, Assess Quality)

This is the step most people skip. And it is the step that separates useful AI adoption from dangerous AI dependence.

AI makes confident-sounding errors. It will cite a BAA number that does not exist. It will attribute a quote to the wrong official. It will state a budget figure with decimal-point precision — and the figure will be fabricated. The text reads fluently, and that fluency makes errors harder to catch.

Your review checklist:

- ☐ **Names and titles.** Is every official's name spelled correctly? Is every title current? The Chief Minister is **Ahod B. Ebrahim**, not "Ahmed." The Speaker is **Pangalian M. Balindong**, not "Pangalian Balindong."[^6]
- ☐ **Legislation references.** Does the BAA number cited actually exist? Does the section number match? Cross-check against the official index of 89 enacted BAAs.[^7]
- ☐ **Budget figures.** Are the amounts correct? Do they match the actual appropriations in the relevant BAA? AI regularly invents plausible-sounding numbers.
- ☐ **Legal provisions.** Are BOL provisions quoted verbatim or paraphrased? If quoted, verify the exact text against the source.
- ☐ **Institutional names.** Does the draft use correct BARMM ministry abbreviations? (MFBM, not DBM. MBHTE, not DepEd. MOH, not DOH. MILG, not DILG.)
- ☐ **Logic and coherence.** Does the analysis actually support the recommendation? Are the sections consistent with each other?

> **The 10-Minute Rule:** Allocate at least 10 minutes of focused review for every 2 pages of AI-generated output. This is non-negotiable. If you do not have time to review it, you do not have time to use it.

3.2.4 Step 4: Refine Iteratively (Improve Through Follow-Up Prompts, Don't Accept First Draft)

The first draft is never the final draft. This is true for human writing. It is equally true for AI output. The difference: AI can revise in seconds instead of hours.

How to give effective feedback to AI:

- **Be specific.** Not "make it better" but "Section III uses passive voice throughout — rewrite in active voice with the committee as the subject."
- **Point to the problem.** Not "the budget section is wrong" but "the figure in paragraph 3 says PHP 4.2 billion but the actual BAA 85 appropriation for MBHTE is PHP 5.1 billion — correct this."
- **Request one change at a time.** Stacking five requests in one prompt produces worse results than making five sequential requests.
- **Add missing context.** If the first draft missed a relevant BAA or stakeholder, provide that information and ask for a revision. "Also consider BAA 18 (Bangsamoro Education Code) which established the education governance framework."

Common refinement patterns:

Problem	Refinement Prompt
Too generic	"Add specific references to BAA provisions and BDP goals"
Too long	"Reduce to 5 pages while keeping all key findings"
Wrong terminology	"Replace all national government agency names with BARMM equivalents"
Missing stakeholders	"Add analysis of how this affects MAFAR and MENRE"
Weak recommendation	"Strengthen the recommendation section with cost-benefit data"
Inconsistent format	"Reformat to match the 13-section legislative briefer structure"

Know when to stop. If you have refined three times and the output still does not meet your standard, the problem is likely in the context (Step 1) or the prompt (Step 2), not in the refinement. Go back to the beginning.

The diminishing returns curve: The first refinement typically captures 60% of the remaining issues. The second captures another 25%. By the third, you are polishing. If major problems persist after three rounds, rewrite your prompt. Four or more refinement rounds on the same prompt usually produce marginal improvement at significant time cost.

3.3 When to Use AI and When Not To

Not every government task benefits from AI. Some tasks are ideal. Others are inappropriate. The decision matrix below helps you choose.

Decision Matrix: Government Tasks Ranked by AI Suitability

Task	AI Suitability	Why	Human Role
Drafting first-version memoranda and correspondence	High	Routine format, clear templates	Review and sign
Summarizing long documents (BAAs, committee reports)	High	AI processes volume faster than any human reader	Verify accuracy of summary
Comparing provisions across multiple BAAs	High	Cross-referencing is labor-intensive for humans, fast for AI	Validate the comparison is correct
Preparing legislative briefer first drafts	High	Structured format, research-heavy	Expert review, policy judgment
Translating documents between English, Filipino, and Arabic	High	Speed and consistency	Verify nuance and cultural accuracy
Formatting data into tables, charts, and visual aids	High	Mechanical formatting task	Check data accuracy
Budget analysis and comparison across fiscal years	High	Number-heavy, pattern-finding	Verify all figures against source
Generating meeting minutes from transcripts	High	Transcription and summarization	Verify names, confirm action items

Task	AI Suitability	Why	Human Role
Drafting training materials and workshop content	High	Volume production, modular content	Subject-matter review
Researching best practices from other jurisdictions	Medium	Good for initial scan, needs human judgment for applicability	Evaluate relevance to BARMM
Drafting policy recommendations	Medium	AI structures well but may miss political context	Validate feasibility, add local knowledge
Preparing interpellation questions	Medium	AI generates thorough questions; human selects strategic ones	Strategic selection, political judgment
Reviewing draft bills for legal consistency	Medium	AI catches textual contradictions; misses intent and precedent	Legal judgment, interpretation
Writing speeches and public statements	Medium	AI produces drafts; speaker's voice needs human shaping	Voice, tone, political sensitivity
Stakeholder analysis and mapping	Medium	AI structures the analysis; human provides real relationships	Local knowledge, relationship context
Final legal interpretation of BOL provisions	Not appropriate	Requires authorized legal judgment with binding consequences	Full human responsibility
Shari'ah rulings and Islamic legal opinions	Not appropriate	Requires qualified religious scholarship and authority	Darul Ifta, Shari'ah scholars
Political strategy and coalition decisions	Not appropriate	Requires lived relationships, trust, and political instinct	Leadership judgment

Task	AI Suitability	Why	Human Role
Personnel evaluation and disciplinary decisions	Not appropriate	Requires fairness, personal observation, due process	Supervisor and HR responsibility
Confidential and classified matters	Not appropriate	Uploading sensitive data to AI tools creates security risks	Handle through secure channels
Moral governance judgments	Not appropriate	Requires accountability, ethical reasoning, and community values	Moral governance council, leadership

The rule of thumb: If the task involves **volume, structure, or speed**, AI helps. If the task involves **judgment, authority, or accountability**, the human leads. Most tasks fall somewhere in between — and that is where the four-step workflow matters most.

How to Read the Matrix

High suitability does not mean "hand it off to AI." It means AI can produce a useful first draft that saves significant time. You still review everything.

Medium suitability means AI provides a helpful starting point, but the output requires substantial human shaping. The AI contributes maybe 40-50% of the final product; your expertise fills the rest.

Not appropriate means the task should not involve AI at all — either because it requires human authority, involves sensitive information that should not be uploaded to AI tools, or depends on judgment that AI cannot provide. Feeding confidential personnel records or classified security briefings into an AI tool creates risks that no time savings can justify.

When in doubt, ask this question: "If someone discovered this document was AI-assisted, would that undermine its credibility or create a legal or ethical problem?" If the answer is yes, handle the task manually.

3.4 Quality Assurance: The "Trust but Verify" Protocol

Every AI output that enters an official government workflow must pass through verification. No exceptions. This is not skepticism about AI — it is the same standard you apply to any staff work product before it reaches a decision-maker.

The "Trust but Verify" Checklist

Use this checklist for every AI-generated document before it leaves your desk:

1. Source Verification - ☐ Every cited BAA number exists in the official index of enacted BAAs[^7] - ☐ Every cited section and article number matches the actual text of the law - ☐ Every cited RA (Republic Act) number is correct and the law is still in force - ☐ Budget figures match the source document (BAA, BBM, or financial report)

2. Name and Title Verification - ☐ Every person named holds the title attributed to them - ☐ Names are spelled correctly (check against official directories) - ☐ Organizational names use BARMM conventions, not national government equivalents - ☐ Committee names match current BTA parliamentary assignments[^8]

3. Logical Consistency - ☐ The analysis supports the conclusion - ☐ Recommendations are consistent with the problem statement - ☐ No internal contradictions between sections - ☐ Cost estimates align with the scope of the proposal

4. Format and Standards Compliance - ☐ The document follows the correct template (13-section briefer, BB-coded budget briefer, policy recommendation format) - ☐ Citations follow the approved format[^9] - ☐ All required sections are present and complete - ☐ The executive summary accurately reflects the body

5. Sensitivity Review - ☐ No Shari'ah or Islamic legal claims are made without proper scholarly authority - ☐ Gender-responsive language is used throughout - ☐ The document respects the moral governance framework[^10] - ☐ No confidential information was exposed to the AI tool

6. Attribution and Transparency - ☐ The document does not claim AI-generated analysis as original research - ☐ If institutional policy requires AI disclosure, the disclosure is included - ☐ The final document reflects the analyst's professional judgment, not raw AI output

> **Verification takes time — and it should.** A 10-page legislative briefer that took 2 hours to generate with AI should get at least 1 hour of verification. If you are not willing to invest that hour, produce the briefer manually instead. AI saves time only when verification is built into the workflow.

When Verification Reveals a Pattern

Track the errors you find. After using AI on five or ten similar documents, you will notice patterns. Perhaps the AI consistently gets BARMM ministry names wrong. Perhaps it fabricates budget figures. Perhaps it misquotes BOL provisions. Each pattern becomes a **gotcha** — a specific instruction you add to future prompts.

For example, if you discover that AI regularly uses "Department of Education" instead of "MBHTE," add this to every education-related prompt: "Use BARMM ministry names throughout. Specifically: MBHTE (not DepEd), MFBM (not DBM), MILG (not DILG), MOH (not DOH), MOLE (not DOLE), MSSD (not DSWD), MENRE (not DENR), MAFAR (not DA)."

Over time, your prompts become more precise, your AI outputs improve, and your verification time decreases. This is the **compounding returns** of disciplined AI use: every error you catch today makes tomorrow's output better.

3.5 Document Management and AI Outputs

AI-generated drafts create a version control problem. Without clear naming conventions, you will lose track of which draft is AI-generated, which is human-reviewed, and which is final. These conventions prevent that.

Naming Conventions

Use this pattern for all AI-assisted documents:

```
[TYPE]-[NUMBER]-[SUBJECT]-[VERSION].[ext]

Examples:
LA-PB245-Revenue-Code-v1-ai.md       ← AI first draft
LA-PB245-Revenue-Code-v2-reviewed.md  ← After human review
LA-PB245-Revenue-Code-v3-final.md     ← Approved for submission
BB-FY2026-MBHTE-v1-ai.md             ← AI-drafted budget briefer
BB-FY2026-MBHTE-v2-final.md          ← Final version
PR-ECCD-Framework-v1-ai.md           ← AI-drafted policy recommendation
```

Document type codes:

Code	Document Type
LA	Legislative Analysis Briefer
BB	Budget Briefer
PR	Policy Recommendation
LO	Legal Opinion
PP	Project Proposal
PA	Personnel/Administrative Action
GN	General CSW
MO	Memorandum/Correspondence
SR	Summary/Research Report

Version Control Rules

1. **Never overwrite an AI draft with your edits.** Save your reviewed version as a new file (v2, v3). This lets you compare what the AI produced against what you submitted.
2. **Mark AI-generated versions clearly.** The `-ai` suffix on version 1 tells anyone looking at the file that it is unreviewed AI output.
3. **Keep final versions separate from drafts.** Only the `-final` version should be transmitted to a decision-maker or attached to a transmittal memo.
4. **Retain the AI conversation.** If your AI tool allows export of the conversation, save it alongside the document. This creates an audit trail showing how the document was produced and what instructions were given.

Folder Structure for AI-Assisted Projects

For complex projects like legislative briefers or policy recommendations that require multiple AI sessions, maintain a project folder:

```
CSW-PB312-ECCD/
├── sources/                  ← Source documents used as AI context
│   ├── PB-312-full-text.pdf
│   ├── BAA-49-excerpts.md
│   └── BDP-Ch5-excerpts.md
├── drafts/
│   ├── LA-PB312-v1-ai.md    ← AI first draft
│   ├── LA-PB312-v2-reviewed.md
│   └── LA-PB312-v3-final.md
├── ai-logs/                  ← Exported AI conversations (optional)
│   └── session-2026-03-15.md
└── transmittal/
    └── TM-PB312-signed.pdf   ← Final transmittal memorandum
```

This structure ensures that anyone inheriting the file can see exactly what sources were used, how the document evolved, and what the AI contributed. It also protects you during audits or quality reviews.

Attribution Practices

Your office should establish a clear policy on AI attribution. At minimum:

- **Internal documents:** Note in the file metadata or cover memo that AI tools assisted in drafting. Example: "Initial draft prepared with AI assistance; all content verified by [analyst name]."
- **Official submissions:** The human author is the author of record. AI is a tool, like a calculator or a database query. You do not credit your spreadsheet software in a budget proposal.
- **Published materials:** Follow whatever disclosure policy your office or the Chief Minister's Office adopts. When no policy exists, err toward transparency.

3.6 Building AI Into Existing Processes, Not Replacing Them

AI is a layer on top of ADDRESS IT. It is not a separate system. Every step in the seven-step CSW process can benefit from AI assistance — but the human remains responsible for every step.

How ADDRESS IT Maps to AI

The table below shows exactly what AI does and what the human does at each step of the ADDRESS IT framework.[^1]

ADDRESS IT Step	What AI Does	What Human Does	Quality Check
Step 1: Analyze the Context	Summarizes source documents. Identifies relevant BOL provisions. Lists stakeholders from similar past initiatives. Extracts key data from reports.	Defines the assignment. Clarifies ambiguities with the superior. Validates stakeholder list from personal knowledge. Confirms which laws apply.	Human verifies AI's document summaries are accurate. Human adds stakeholders AI missed.
Step 2: Define and Deliberate	Generates problem statement drafts. Identifies potential root causes from similar documented cases. Produces PESTEL analysis frameworks.	Engages stakeholders in actual deliberation. Selects the true root cause. Establishes SMART objectives. Validates problem statement.	Human confirms problem statement matches reality, not just what documents say.
Step 3: Research	Scans large document sets. Compiles comparative analyses. Identifies relevant provisions across multiple BAAs. Summarizes academic literature.	Designs the research plan. Evaluates source credibility. Conducts primary data collection (interviews, field visits). Validates findings.	Human verifies all AI-cited sources exist and say what AI claims they say.

ADDRESS IT Step	What AI Does	What Human Does	Quality Check
Step 4: Explore Options	Generates option frameworks. Drafts pro/con comparisons. Produces cost-benefit analysis templates. Identifies precedents from other jurisdictions.	Evaluates feasibility from local knowledge. Conducts stakeholder consultations. Applies political and cultural judgment. Selects the best option.	Human validates that AI-generated options are actually implementable in BARMM.
Step 5: Submit Proposal	Drafts the full report. Formats according to template. Writes executive summary. Generates visual aids (tables, charts).	Reviews every page. Verifies all facts. Refines recommendations. Obtains supervisor clearance. Signs and submits.	Supervisor reviews the final product. "Trust but Verify" checklist is completed.
Step 6: Sustain Implementation	Tracks milestones against the implementation plan. Drafts progress reports. Generates monitoring dashboards.	Mobilizes resources. Coordinates with partners. Addresses political obstacles. Maintains stakeholder relationships.	Human confirms AI-tracked progress matches ground reality.
Step 7: Iterate and Improve	Analyzes performance data. Identifies trends. Compares outcomes against targets. Drafts evaluation reports.	Interprets what the data means. Decides what to change. Engages stakeholders in feedback. Documents lessons learned.	Human validates that AI-identified patterns are real, not statistical artifacts.

The Overlay Principle

Notice that AI never *replaces* a step. It augments each one. The ADDRESS IT process remains intact. The staff member still walks through all seven steps. The difference is that steps involving heavy reading, drafting, and data processing now take hours instead of days.

This is deliberate. If your office adopts AI today and the tools disappear tomorrow, your ADDRESS IT process still works. You just return to manual methods. AI is an accelerator, not a dependency.

Why this matters for BARMM specifically: The Bangsamoro government is in a transition period. Staff turnover is high. Institutional memory is thin. Processes that depend entirely on AI tools become fragile — if the subscription lapses, the internet goes down, or the tool changes its features, work stops. Processes that use AI as an overlay on ADDRESS IT are resilient. The seven steps provide the backbone. AI provides the speed.

A practical test: After completing any AI-assisted task, ask yourself: "Could I explain to my supervisor exactly how I arrived at this recommendation, step by step, without mentioning AI?" If the answer is yes, you used AI correctly — as a tool within a sound process. If the answer is no — if you cannot justify the analysis without saying "the AI told me" — then you relied on AI instead of overlaying it. Go back to the four-step workflow and add more of your own analysis.

Cross-Reference to Other Guidebooks

The ADDRESS IT framework is covered in full in the *Complete Staff Work Guidebook for the Bangsamoro Autonomous Region*, Chapters 4-10.[^1] If you have not read that guidebook, start with the ADDRESS IT Quick Reference Card (Appendix A of the CSW guidebook) to understand each step before mapping AI onto it.

For specific document types that benefit from AI assistance: - **Legislative briefers** — see this guidebook, Chapter 7 (AI for Legislative and Policy Work) and the CSW guidebook, Chapter 11 (CSW for Parliamentary Committees) - **Budget briefers** — see this guidebook, Chapter 6 (AI for Budgeting and Financial Analysis) and the CSW guidebook, Chapter 12, Section 12.1 - **Policy recommendations** — see this guidebook, Chapter 7, Section 7.6 and the CSW guidebook, Chapter 3, Section 3.4 - **Project proposals** — see this guidebook, Chapter 8 (AI for Program Implementation) and the CSW guidebook, Chapter 12, Section 12.2

Appendix E of this guidebook provides a complete mapping of AI assistance to every ADDRESS IT step, with specific prompts for each.

Case Study: Using AI to Prepare a Legislative Briefer

> **Scenario:** You are a legislative analyst assigned to the Committee on Basic, Higher, and Technical Education. The committee chair asks you to prepare a legislative briefer for Proposed Bill No. 312 (Bangsamoro Early Childhood Care and Development Act). You have three days before the committee session.

Step 1: Prepare Context (Day 1 Morning — 2 Hours)

You gather the source materials: - Full text of Proposed Bill No. 312 - BOL, Article IX (Education) and Article XIII, Section 4 (powers of the BTA) - BAA 18 (Bangsamoro Education Code) — the existing education framework - RA 8980 (ECCD Act, national law) — the law PB 312 aims to localize - Committee records from previous hearings, if any - BDP 2023-2028, Chapter 5 (Human Capital Development goals)

You upload or paste these documents into your AI tool. You note the boundaries: the briefer should analyze the bill, not recommend a vote.

Step 2: Prompt Clearly (Day 1 Afternoon — 1 Hour)

You write:

```
You are a legislative analyst for the BTA Committee on Basic, Higher,
and Technical Education.

Draft a 13-section legislative briefer for Proposed Bill No. 312
(Bangsamoro ECCD Act). Use the standard legislative briefer format:

I. Overview
II. Brief Description of the Measure
III. Previous Proceedings and Committee Actions
IV. Summary of Key Provisions
V. Implementing Agencies and Institutional Framework
VI. Financial Implications
VII. Legal and Constitutional Analysis (BOL, RA 8980, BAA 49)
VIII. Comparative Analysis with National ECCD Framework
IX. Stakeholder Impact Assessment
X. Parliamentary Strategy and Expected Debates
XI. Proposed Committee Amendments
XII. Recommended Committee Position and Vote
XIII. Strategic Intelligence for the Committee Chair

Base your analysis on the documents I provided. Use BARMM
terminology (MBHTE, not DepEd). Mark any information you cannot
verify with [UNVERIFIED]. Do not fabricate committee proceedings.
```

The AI generates a 12-page first draft in approximately 3 minutes.

Step 3: Review Critically (Day 2 — 3 Hours)

You read every section against the source documents: - Section VII claims Article IX, Section 3 of the BOL grants explicit ECCD authority. You check: the actual BOL text does not mention ECCD specifically, only “basic education.” You correct this. - Section VI estimates a PHP 500 million annual implementation cost. No source is given. You mark this [UNVERIFIED] and search the bill’s explanatory note for actual figures. - Section V lists the “Department of Social Welfare” as a co-implementer. You correct this to MSSD (Ministry of Social Services and Development). - The draft names a committee member incorrectly. You correct the name and title.

You run through the full “Trust but Verify” checklist from Section 3.4.

Step 4: Refine Iteratively (Day 2 Afternoon — 2 Hours)

You provide three rounds of feedback:

Round 1: “Section VII needs to clarify that ECCD is implied but not explicit in the BOL’s education provisions. Rewrite the constitutional analysis to reflect this gap.”

Round 2: "Add a comparison table showing how PB 312 differs from RA 8980 in at least 8 specific provisions — service delivery structure, funding mechanism, quality standards, age coverage, curriculum authority, personnel requirements, coordination mechanism, and oversight framework."

Round 3: "The recommendation in Section XII is too vague. Draft three specific conditions the committee should attach to approval, based on the gaps identified in Sections VII and VIII."

Result

Time comparison:

Activity	Without AI	With AI
Gathering source documents	3 hours	2 hours (same research, slightly faster with AI-assisted search)
Reading and analyzing sources	8 hours	4 hours (AI summarizes, human verifies)
Drafting the briefer	10 hours	1 hour (AI drafts) + 3 hours (human reviews)
Revision and formatting	3 hours	2 hours (AI revises, human finalizes)
Total	**24 hours (3 full days)**	**12 hours (1.5 days)**

The analyst saved approximately 50% of total time. More importantly, the quality of the comparative analysis in Section VIII was higher because the AI could systematically compare provisions across two laws — a task that is tedious and error-prone when done manually.

What went wrong and how it was caught: - The AI fabricated a committee hearing date in Section III. The analyst caught this because no hearings had been conducted yet. **Lesson:** AI fills gaps with plausible-sounding fiction. Always verify procedural facts. - The AI used "DepEd" four times instead of "MBHTE." The analyst corrected every instance. **Lesson:** AI defaults to national government terminology. Always search for incorrect agency names before submitting. - The cost estimate in Section VI had no source. The analyst

either found a source or marked it [UNVERIFIED] with a note explaining the estimate's basis. **Lesson:** Unsourced numbers are the most dangerous AI output. Every figure needs a citation.

The AI produced the structure and the first draft. The analyst produced the accuracy, the judgment, and the final product worthy of a committee chair's desk.

Chapter Summary

The AI-augmented workflow rests on five principles:

1. **AI drafts, you decide.** The human-AI partnership mirrors CSW: the staff does the work, the decision-maker approves. AI is the staff; you are the decision-maker over AI's output.
2. **Four steps, every time.** Prepare Context, Prompt Clearly, Review Critically, Refine Iteratively. Skip the review step and you risk submitting fabricated information.
3. **Not every task needs AI.** Use the decision matrix. High-volume, structured, research-heavy tasks benefit most. Final legal interpretations, Shari'ah rulings, and political judgments stay fully human.
4. **Trust but verify — always.** The six-part checklist applies to every AI-generated document. Sources, names, logic, format, sensitivity, and attribution.
5. **Overlay, do not replace.** AI maps onto every ADDRESS IT step without changing the process. If the tools vanish, your workflow survives.

The next chapter shows you how to build the document foundation that makes AI useful: how to prepare government documents, structure a knowledge base, and manage the data that feeds every prompt.

Footnotes

[^1]: The ADDRESS IT framework is a seven-step CSW methodology (Analyze, Define and Deliberate, Research, Explore Options, Submit Proposal, Sustain Efforts, Iterate and Improve) developed for BARMM governance. See the *Complete Staff Work Guidebook for the Bangsamoro Autonomous Region* (Mambayao, 2026), particularly the ADDRESS IT Quick Reference in Appendix A. The full framework is detailed in Chapters 4-10 of that guidebook.

[^2]: The principle that "the decision-maker should only need to approve or disapprove" is the foundational standard of Complete Staff Work as institutionalized in Philippine governance through Civil Service Commission Memorandum Circular No. 72, s. 2019 ("Institutionalization of the Practice of Complete Staff Work in Government") and Memorandum Circular No. 2, s. 2022 (superseding MC 72). See *Complete Staff Work Guidebook for the Bangsamoro Autonomous Region*, Chapter 1, Section 1.1.1.

[^3]: The four-step workflow synthesizes practitioner patterns from AI-augmented document production. The "Prepare, Prompt, Review, Refine" cycle is adapted from structured skill workflows documented by practitioners working with Claude Code and similar AI tools. See AI-Claude-Code GUIDE (2026), particularly the Five-Skill Workflow discussion.

[^4]: BAA 84 (Bangsamoro Budget System Act) establishes the legal framework for the BARMM budget cycle, including preparation, authorization, execution, and accountability. Budget Call Memoranda (BBMs) are issued annually by MFBM to guide budget preparation for the upcoming fiscal year.

[^5]: Republic Act No. 11054, or the Bangsamoro Organic Law (BOL), is the foundational law establishing the Bangsamoro Autonomous Region in Muslim Mindanao. Its 18 Articles define the powers, structure, and fiscal framework of the Bangsamoro government.

[^6]: Official names and titles of BARMM officials should always be verified against current official directories. Officials referenced in this guidebook reflect the BTA membership for the transition period as of 2025-2026. Names and positions change — always verify before finalizing any document.

[^7]: The Bangsamoro Parliament has enacted 89 Bangsamoro Autonomy Acts (BAAs) as of the current transition period. An index of all enacted BAAs is maintained and should be the authoritative reference for verifying BAA numbers and titles.

[^8]: BTA Parliamentary and Committee Assignments are published periodically. The most recent assignments should be verified against official Parliament records.

[^9]: Philippine Manual of Legal Citations (Feliciano, 10th Ed.) is the standard reference for citation format in Philippine legal and government documents.

[^10]: The moral governance framework is established under BAA 13 (Bangsamoro Moral Governance Act), which institutionalizes the 12 Pillars of Moral Governance for the BARMM. See *Complete Staff Work Guidebook for the Bangsamoro Autonomous Region*, Chapter 2, Section 2.3.

04

Data, Documents, and the BARMM Knowledge Base

Every AI tool you use is only as good as the documents you feed it. A brilliant analyst with an empty desk produces nothing. An AI assistant with no reference material produces hallucinations. This chapter teaches you how to organize the massive documentary output of BARMM governance into a structured knowledge base that makes AI dramatically more useful — and how to protect sensitive information while doing so.

4.1 The Document Universe of BARMM Governance

The Bangsamoro Government generates an extraordinary volume of documents. Consider what the BTA Parliament alone has produced since 2019:

- **89 Bangsamoro Autonomy Acts (BAAs)** spanning governance, budgeting, health, education, labor, local government creation, electoral reform, peace and security, and symbols of identity[^1]
- **570+ resolutions** — both proposed and adopted — covering everything from expressing condolences to directing executive action
- **424+ proposed bills** filed across three BTA compositions, with hundreds still pending deliberation
- The **Bangsamoro Organic Law (Republic Act No. 11054)**, the foundational 18-article charter that defines every power, right, and institution in BARMM[^2]
- The **2nd Bangsamoro Development Plan (BDP) 2023-2028**, a 15-chapter roadmap covering six development goals and eight strategies

That is the Parliament alone. Add the executive side:

- **Executive Orders** from the Office of the Chief Minister
- **Bangsamoro Budget Memoranda** governing the annual budget cycle
- **Manuals of Operations (MOPs)** for ministries, offices, and agencies
- **Committee reports** from 48 standing committees analyzing every bill before plenary
- **Implementing Rules and Regulations (IRRs)** for enacted legislation
- **Administrative orders, memorandum circulars, and special orders** governing daily operations across 27 ministries and offices

No single staff member can hold all of this in memory. No filing cabinet can make it searchable. But a well-organized digital collection combined with AI can.

BARMM Document Types and Their AI Use Potential

Document Type	Example	Volume	AI Use Potential	Caution
Bangsamoro Autonomy Acts	BAA 13 (Administrative Code)	89 enacted	Cross-referencing, amendment tracking, gap analysis, summarization	AI may cite wrong section numbers; always verify against official text
Proposed Bills	PB-424	424+ filed	Legislative comparison, drafting assistance, policy analysis	Bills may have multiple versions; confirm which version is current
Resolutions (Adopted)	Resolution directing MFBM action	300+ adopted	Pattern detection, tracking executive compliance	Distinguish between adopted and proposed resolutions
Resolutions (Proposed)	Proposed resolution on education	270+ proposed	Identifying legislative priorities and trends	Many remain unfiled; status tracking is incomplete
Bangsamoro Organic Law	RA 11054, Art. XII (Fiscal Autonomy)	1 (18 articles)	Constitutional analysis, power-mapping, jurisdictional questions	AI struggles with hierarchical interpretation between BOL and national law
BDP 2023-2028	Chapter 5 (Social Development)	1 (15 chapters)	Planning alignment, gap analysis, performance benchmarking	BDP goals are aspirational; AI may treat targets as achievements
Executive Orders	EOs from the Office of the Chief Minister	50+	Policy tracking, executive-legislative alignment analysis	Not always publicly catalogued; collection may be incomplete

Document Type	Example	Volume	AI Use Potential	Caution
Committee Reports	Report on BAA 84 (Budget System Act)	Hundreds	Understanding legislative intent, tracking deliberations	Reports may not be digitized or publicly available
IRRs	IRR of BAA 35 (Electoral Code)	Varies per BAA	Implementation analysis, compliance checking	IRRs lag behind legislation; some BAAs have no IRR yet
MOPs and Administrative Orders	MOP of MBHTE	Per ministry	Process mapping, compliance verification, benchmarking	MOPs may be outdated; verify version currency
Budget Documents	GAA FY 2026 (BAA 85), BBM 2025-002	Annual	Expenditure analysis, trend comparison, allocation tracking	Budget figures require careful context; AI may mix fiscal years
Speeches and Statements	Chief Minister's SOBA	Periodic	Sentiment analysis, commitment tracking, policy direction mapping	Distinguish between policy commitments and rhetorical emphasis

This table is not exhaustive. Every provincial government, city, and municipality within BARMM generates its own layer of documentation. The point is this: **the raw material for AI-assisted governance work already exists**. The challenge is making it accessible.

4.2 Preparing Government Documents for AI Analysis

Most AI tools work best with clean, structured text. A scanned PDF of a resolution — tilted, blurry, with handwritten marginal notes — is nearly useless to an AI system. A well-formatted markdown file of the same resolution is instantly searchable, quotable, and cross-referenceable.

The Document Preparation Pipeline

Preparing a government document for AI analysis follows four steps:

Step 1: Obtain the digital source. Start with the best available version. A Word document is better than a PDF. A PDF generated from a Word document (a "native PDF") is better than a scanned image PDF. If the only version is a physical paper copy, scan it at 300 DPI minimum, in black and white, with the pages straight and well-lit.

Step 2: Extract the text. For native PDFs, copy-paste works. For scanned documents, you need **Optical Character Recognition (OCR)** — software that reads images and converts them to editable text. Free OCR tools include Adobe Acrobat's built-in OCR, Google Drive's automatic OCR (upload the PDF and open it as a Google Doc), and open-source tools like Tesseract. OCR output always contains errors. Expect misspelled words, merged paragraphs, and garbled tables.

Step 3: Clean and structure the text. This is the most labor-intensive step — and the one that pays the highest dividends. Clean the OCR output:

- Fix spelling errors, especially proper nouns (**BARMM**, **Maguindanao del Norte**, **Bangsamoro**)
- Restore paragraph breaks and section numbering
- Recreate tables that OCR flattened into jumbled text
- Remove headers, footers, and page numbers that OCR captured as body text
- Add **markdown formatting**: headings (`#`, `##`, `###`), bold for key terms, numbered lists for enumerated provisions

Step 4: Apply a consistent file naming convention. Every document needs a predictable filename. A naming convention allows both humans and AI to locate documents quickly. Use this pattern:

```
[TYPE]-[NUMBER].[extension]
```

Examples: - `BAA-13.md` (Bangsamoro Administrative Code) - `BAA-85.md` (GAA FY 2026) - `PB-424.md` (Proposed Bill No. 424) - `Resolution-150.md` (Resolution No. 150)

For documents without official numbers, use a date-based convention:

```
[TYPE]-[YYYY-MM-DD]-[short-description].[extension]
```

Examples: - `EO-2025-07-30-sulu-realignment.md` - `BBM-2025-002-budget-call-fy2026.md`

Why Markdown?

Markdown is a lightweight text format that uses simple symbols for formatting. It is human-readable, machine-readable, and works with every AI tool. A markdown file is just a text file — it opens in any text editor, on any device, with no special software. Yet it preserves structure: headings, lists, tables, bold text, links.

Compare these two versions of the same provision:

Scanned PDF (after OCR):

> SEC. 9. Seat of Government. — The seat of government of the Bangsamoro Autonomous Region shall be in the Municipality of Parang, Province of Maguindanao del Norte. (As amended by BAA No. 37)

Structured markdown:

```
### Section 9. Seat of Government

The seat of government of the Bangsamoro Autonomous Region shall be in the
Municipality of Parang, Province of Maguindanao del Norte.

*As amended by [BAA 37](BAA-37.md)*
```

The markdown version tells AI exactly what is a heading, what is body text, and where to find the amending legislation. This structure makes AI responses more accurate because the AI can navigate the document the same way you do — by section, by heading, by cross-reference.

4.3 Building an Institutional Knowledge Base

A scattered collection of files on a shared drive is not a knowledge base. A knowledge base is an **organized, searchable, interlinked collection** designed for rapid retrieval. The principle is simple: **organized documents make AI dramatically more useful**.

This is the "second brain" principle adapted for government offices. Your personal memory is limited. Your office's institutional memory is fragile — staff transfer, hard drives crash, email accounts expire. A knowledge base survives all of these because the knowledge lives in the structure, not in any individual's head.

The Three-Tier Architecture

Build your knowledge base in three tiers:

Tier 1: Legislation and Legal References (read-only) These are your authoritative sources. They change only when Parliament enacts new laws or the Supreme Court issues a ruling.

```
knowledge-base/
  legislation/
    bol/
      RA-11054-Article-I.md
      RA-11054-Article-II.md
      ...
      RA-11054-Article-XVIII.md
    baas/
      BAA-1.md through BAA-89.md
    resolutions/
      adopted/
        Resolution-1.md through Resolution-350.md

Making It Searchable

Structure alone is not enough. Three practices make your knowledge base genuinely searchable:

1. Consistent headings. Every BAA file should follow the same heading structure: title, preamble, sections. Every resolution should follow the same structure: whereas clauses, resolving clauses. Consistent structure lets AI find equivalent sections across hundreds of documents.

2. Index files. Create an index file at the top of each major folder. The BAA index should list every BAA with its number, short title, category, and date of enactment. The resolution index should list every resolution with its status (adopted, proposed, withdrawn). Index files give AI a map of your collection before it reads any individual document.

3. Cross-references. When BAA 37 amends BAA 13, the markdown file for BAA 37 should contain a link to BAA 13, and vice versa. When a committee report analyzes PB-200, the report should link to the bill. Cross-references create a web of connections that AI can navigate — surfacing relationships you might miss when reading documents in isolation.

> **Case Study: Building a Searchable BAA Library**
>
> The BTA Parliament has enacted 89 BAAs across 13 categories: Budget and Appropriations (18), Local Government (14), Health (13), Electoral (6), Symbols and Identity (6), Social Welfare and Human Rights (6), Governance and Administration (5), Education and Culture (5), Economy and Labor (5), Peace and Security (3), Environment and Development (2), Human Rights (1), and Miscellaneous (5).[^1]
>
> When all 89 BAAs are transcribed into structured markdown files with consistent headings, an index file, and cross-references for amendment chains, AI can instantly answer questions that would take a researcher hours:
>
> - *"Which BAAs have been amended, and by what?"* — The amendment chain shows 12 BAAs that amend or extend other BAAs. BAA 87 and BAA 88 both amend BAA 35 (Electoral Code). BAA 37 amends BAA 13 (Administrative Code). BAA 70 and BAA 71 amend the municipality creation acts BAA 54 and BAA 55.
> - *"How many hospital upgrade bills has the Parliament passed?"* — Thirteen health-related BAAs, including nine hospital upgrades across Maguindanao, Lanao del Sur, Sulu, Basilan, and Tawi-Tawi.
> - *"What municipalities has the BTA created?"* — Twelve new municipalities: Pahamuddin, Kadayangan, Nabalawag, Old Kaabakan, Kapalawan, Malidegao, Tugunan, Ligawasan, Nuling, Datu Sinsuat Balabaran, Sheik Abas Hamza (all in Maguindanao del Norte), plus others.
> - *"Which priority codes remain unenacted?"* — Four of seven priority codes are enacted (Administrative Code, Civil Service Code, Education Code, Electoral Code). Three remain: Revenue Code, Local Government Code, and Investment Code.[^2]
>
> None of these answers require AI to "know" Bangsamoro legislation from its training data. The AI reads your organized collection and synthesizes. **The quality of your knowledge base determines the quality of the AI's answers.**

The Compounding Effect

A knowledge base produces returns that compound over time. On day one, you have 10 documents and AI can answer basic questions. By month three, you have 200 documents and AI can cross-reference legislation against policy against implementation reports. By year one, you have a comprehensive institutional archive that survives staff turnover, office reorganization, and political transitions.

The BTA has operated under three compositions since 2019. Each transition brought new members, new priorities, and new staff. The institutional knowledge that was not written down was lost. A knowledge base prevents this. When the first regular Bangsamoro Government takes office after the 2028 elections, the offices with organized knowledge bases will transition smoothly. Those without them will start from scratch — again.

Start small. Pick one category of documents your office handles daily. Convert them to structured markdown. Build the index. Add metadata headers. Then expand.

Folder Structures for Different Offices

Not every office needs the same knowledge base. Adapt the three-tier structure to your function:

- **Committee Secretariat**: Prioritize Tier 1 (all BAAs and bills assigned to your committee) and Tier 3 (active committee reports, hearing schedules, witness testimonies)
- **Budget Office (MFBM)**: Prioritize Tier 2 (all GAAs, budget memoranda, SDF allocation documents) and Tier 1 (BAA 84 Budget System Act, BOL Art. XII on fiscal autonomy)
- **Ministry Planning Division**: Prioritize Tier 2 (BDP chapters relevant to your ministry, AIP templates) and Tier 3 (current plans, M&E reports)
- **Office of the Chief Minister**: All three tiers, with emphasis on cross-cutting documents that span multiple ministries

Tagging and Metadata

Add a **metadata header** to every document in your knowledge base. This header tells AI what the document is, when it was produced, and how to classify it:

```
---
type: BAA
number: 84
title: Bangsamoro Budget System Act of 2025
category: Budget & Appropriations
date_enacted: 2025
status: enacted
amends: null
amended_by: null
classification: public
---
```

Metadata headers enable AI to filter, sort, and compare documents without reading their full text. Ask “list all BAAs in the Health category enacted after 2023” and the AI scans metadata headers, not 89 full documents.

4.4 Data Privacy and Information Classification

Not every government document belongs in an AI tool. The **Data Privacy Act of 2012 (Republic Act No. 10173)** governs how personal information must be collected, processed, and stored — and it applies fully to BARMM government offices.[^3]

What RA 10173 Requires

The Data Privacy Act establishes three key principles for government data handling:

Transparency. Data subjects (citizens, employees, constituents) must know that their personal information is being collected and how it will be used.[^4]

Legitimate purpose. Personal information must be processed only for purposes that are declared, specified, and legitimate.[^5]

Proportionality. The processing of personal information must be adequate, relevant, and not excessive in relation to the purpose.[^6]

When you paste a document containing personal information into an AI tool, you are **processing** that data. The AI tool's servers receive, store (temporarily or otherwise), and analyze the information. This triggers RA 10173 obligations.

The Information Classification Framework

Every BARMM office should classify its documents into four categories before deciding what can be shared with AI tools:

Classification	Definition	Examples	AI Use Guidance
Public	Published or intended for public access; no restriction on sharing	Enacted BAAs, adopted resolutions, official speeches, published BDP chapters, press releases, public budget documents (GAA)	Safe for any AI tool. These documents are already in the public domain.
Internal	For government use; not classified but not published	Draft MOPs, internal memoranda, committee meeting	Use with caution. Remove any personal identifiers

Classification	Definition	Examples	AI Use Guidance
		minutes, interoffice correspondence, draft IRRs	before sharing. Avoid cloud-based AI tools unless your office has a data processing agreement.
Confidential	Contains sensitive personal or institutional information	Personnel records (201 files), medical records, disciplinary proceedings, salary details, employee evaluations, tax records, bid proposals before opening	**Do not share with AI tools.** Process these documents manually or use only on-premise, air-gapped AI systems.
Restricted	National security, peace process, or classified government intelligence	Intelligence reports, peace negotiation documents, military coordination records, decommissioning lists, witness protection information	**Never share with any AI tool under any circumstance.** Handle through classified channels only.

Practical Rules for AI Data Handling

Follow these rules when deciding whether to use a document with AI:

Rule 1: Strip personal identifiers. Before feeding any internal document to an AI tool, remove names, addresses, phone numbers, ID numbers, and other personally identifiable information (PII). Replace them with placeholders: `[Employee Name]`, `[Address]`, `[ID Number]`.

Rule 2: Use the "newspaper test." If the document appeared on the front page of a newspaper tomorrow, would anyone be harmed? If yes, do not share it with a cloud-based AI tool.

Rule 3: Distinguish between the document and the pattern. You cannot share a specific employee's performance evaluation with AI. But you can share the **template** for performance evaluations and ask AI to help you improve the format, scoring criteria, or instructions.

Rule 4: Check your AI tool's data policy. Different AI tools handle your data differently. Some tools use your inputs to train their models. Others do not. Read the terms of service. As of 2026, Claude (Anthropic) does not use conversation data for training when accessed through the API or Team/Enterprise plans.[^7] Google's NotebookLM processes documents on Google's servers but does not train its models on uploaded content.[^8] Policies change. Verify before you share.

Rule 5: When in doubt, ask your Data Protection Officer. RA 10173 requires government agencies to designate a Data Protection Officer (DPO).[^9] If you are unsure whether a document can be shared with an AI tool, ask your DPO. The cost of asking is a few minutes. The cost of a data breach is a compliance investigation.

Common Scenarios and How to Handle Them

Scenario: You need AI to draft a committee report. The committee report references testimony from named witnesses, their positions, and their statements. Strip the names and replace with role descriptions: "[Witness 1, Municipal Mayor]" instead of the actual name. Keep the substance. Remove the identifiers.

Scenario: You need AI to analyze budget utilization by office. The budget data itself (allocation amounts, utilization rates, program expenditures) is generally Public or Internal. But if the analysis involves specific personnel costs tied to named employees, remove the names. Aggregate where possible: "Division X has 15 positions with a total PS allocation of PHP 12M" rather than listing each employee's salary.

Scenario: You need AI to help draft a disciplinary resolution. Stop. Disciplinary proceedings involve Confidential personnel information. Do not share the specifics with any cloud-based AI tool. You may ask AI for help with the **format and structure** of a disciplinary resolution using a blank template, but never include case-specific details.

Scenario: You need AI to cross-reference a peace process document. If the document is a published peace agreement (like the Comprehensive Agreement on the Bangsamoro), it is Public. If it is an internal negotiation brief, intelligence assessment, or decommissioning schedule, it is Restricted. Know the difference before you type.

The BOL's Transparency Mandate

The Bangsamoro Organic Law contains its own transparency provisions. Article IX recognizes the right of the people to information on matters of public concern.[^10] Article VII provides for an open and transparent government through the Parliament's proceedings.

[^11] These provisions create a **presumption of openness** for legislative documents — enacted laws, resolutions, committee reports, and plenary proceedings are public by nature.

This means most Tier 1 legislative documents are safe for AI analysis. The privacy risk concentrates in Tier 3 working documents and personnel-related materials.

4.5 Working with Philippine and Bangsamoro Legal Texts

Legal texts are where AI is simultaneously most useful and most dangerous. The usefulness comes from AI's ability to read and cross-reference hundreds of documents in seconds. The danger comes from AI's tendency to fabricate details that sound authoritative.

What AI Does Well with Legal Texts

Cross-referencing. Ask AI to identify every BAA that amends another BAA. With a structured knowledge base, AI produces the complete amendment chain in seconds: BAA 14 extends BAA 3. BAA 33 amends BAA 23. BAA 37 amends BAA 13. BAA 87 and BAA 88 both amend BAA 35. Twelve amendment relationships across 89 BAAs — a task that would take a researcher an hour of manual checking.[^1]

Summarization. Ask AI to summarize BAA 85 (GAA FY 2026) into a one-page briefer for a Member of Parliament. AI excels at condensing long, repetitive legislative text into structured summaries with clear headings.

Pattern detection. Ask AI to categorize all 89 BAAs by domain. AI identifies that Budget and Appropriations dominates with 18 BAAs, followed by Local Government (14) and Health (13). Ask AI to identify trends: hospital upgrade legislation has accelerated since 2023, with nine health infrastructure BAAs covering hospitals across five provinces.

Gap analysis. Ask AI which of the seven priority codes mandated by the BOL's transition provisions remain unenacted. AI compares the list against the 89 enacted BAAs and identifies Revenue Code, Local Government Code, and Investment Code as outstanding.[^2]

Comparative analysis. Ask AI to compare a proposed bill against existing BAAs to identify conflicts, overlaps, or gaps. Feed it PB-200 and BAA 49 (Local Governance Code) and ask: "Does this proposed bill create any entity that already exists under BAA 49?"

What AI Gets Wrong with Legal Texts

AI makes specific, predictable errors with legal texts. Learn these patterns and you can catch them before they reach an official document.

AI Pitfall	What Happens	Real Example	How to Catch It
Wrong BAA number	AI cites the correct content but assigns it to the wrong BAA	"BAA 35 creates the Bangsamoro Human Rights Commission" (actually BAA 4; BAA 35 is the Electoral Code)	Cross-check every BAA number against the BAA index
Fabricated section	AI invents a section number that does not exist in the cited law	"Section 42 of the BOL provides for AI governance" (no such section exists)	Verify every section citation against the source document
Misquoted provision	AI paraphrases a provision and presents the paraphrase as a direct quote	"The BOL states that the annual block grant shall be 7% of national revenue" (the actual figure is 5% per Art. XII, Sec. 15)	Never trust AI-generated "quotations" of legal text; verify verbatim wording
Conflated provisions	AI merges provisions from different articles or different laws into one statement	"The BOL's Special Development Fund of PHP 5B annually is found in Article XII" (SDF is in Art. XIV, Sec. 2, not Art. XII)[^2]	Check not just the content but the specific article and section
Outdated information	AI references provisions that have been amended or superseded	"BAA 58 establishes the parliamentary districts of BARMM" (BAA 58 was declared unconstitutional; BAA 86 now governs redistricting)[^12]	Check the amendment chain for any cited BAA
Hierarchical confusion	AI treats a BAA provision as overriding national law, or vice versa	"BARMM can unilaterally establish its own labor standards" (labor is an overlapping jurisdiction requiring harmonization per BOL Art. V)	Verify jurisdictional scope through Art. V enumerated powers

AI Pitfall	What Happens	Real Example	How to Catch It
False consensus	AI states that a bill "was enacted" when it was only proposed	"The Revenue Code was enacted as BAA 90" (the Revenue Code has not been enacted as of March 2026)	Verify enactment status against the BAA index and parliamentary records

How to Prompt AI for Legal Research

The way you frame a legal question determines the quality of the answer. Follow these prompting principles:

Specify the source. Do not ask "What does the law say about fiscal autonomy?" Ask "What does Article XII of RA 11054 say about the annual block grant?" The more specific your reference, the less room AI has to fabricate.

Provide the documents. Do not rely on AI's training data for legal text. Paste or attach the actual BAA, resolution, or BOL article. When AI reads your document rather than recalling from memory, accuracy improves dramatically.

Ask for citations. End every legal prompt with: "Cite the specific section, article, and law for every claim." This forces AI to ground its response in identifiable sources you can verify.

Request uncertainty flags. Add: "If you are not certain about any fact, say so explicitly." AI tools are capable of expressing uncertainty — but they default to confident-sounding answers unless you ask them to flag doubts.

The Verification Protocol for Legal AI Outputs

Every time AI produces a legal citation, run this five-point check:

1. **Number check.** Is the BAA/RA/resolution number correct? Cross-reference against your index.
2. **Section check.** Does the cited section actually exist in that law? Open the source document.
3. **Verbatim check.** If AI presents text as a quotation, compare it word-for-word against the source.
4. **Currency check.** Has the cited provision been amended or repealed? Check the amendment chain.

5. **Jurisdiction check.** Is the matter within BARMM's enumerated powers (BOL Art. V, Sec. 2), shared jurisdiction, or exclusive national government authority?[^13]

This protocol takes two to five minutes per citation. It is not optional. A single wrong BAA number in an official briefer undermines the credibility of every other fact in the document.

Working with the BOL's Unique Structure

The Bangsamoro Organic Law has structural features that trip up AI tools:

The enumerated powers list. Article V, Section 2 lists 55 subject areas from (a) to (ccc). AI tools frequently miscount items in long enumerated lists or assign the wrong letter to a subject area. When citing a specific power, provide the letter designation and verify it.[^13]

Overlapping jurisdiction. Some BOL enumerated powers overlap with national legislation — education, labor, disaster management, environmental protection. AI may state definitively that BARMM "has authority over" a matter when the reality is shared jurisdiction requiring harmonization through the intergovernmental relations mechanisms in Article VI.[^13]

The transition provisions. Article XVI governs the BTA's mandate, which has been extended twice (RA 11593 to 2025, RA 12064 to 2028). AI training data may reflect earlier timelines. Always specify the current transition status when prompting AI about BTA-related questions.[^2]

The Sulu exclusion. The Supreme Court ruled in *Province of Sulu v. Medialdea* (G.R. Nos. 242255, 243246, 243693; September 9, 2024, finalized November 26, 2024) that Sulu is not part of BARMM. EO 91 (July 30, 2025) realigned Sulu under Region IX.[^2] AI trained on data before late 2024 may still include Sulu in BARMM's territorial scope. Correct this explicitly in your prompts.

Key Takeaways

1. **The raw material already exists.** BARMM's 89 BAAs, 570+ resolutions, 424+ proposed bills, and hundreds of policy documents contain the institutional knowledge your office needs. The bottleneck is organization, not creation.
2. **Structure determines AI quality.** A well-formatted markdown file with consistent headings, metadata, and cross-references produces dramatically better AI outputs than a scanned PDF or unstructured Word document.
3. **Build your knowledge base in three tiers.** Legislation and legal references (read-only), policy and planning documents (periodic updates), and working documents (active use). Start with whatever your office produces most.
4. **Classify before you share.** Use the four-level classification framework (Public, Internal, Confidential, Restricted) and never share Confidential or Restricted documents with cloud-based AI tools.
5. **Trust AI for pattern work, not precision work.** AI excels at cross-referencing, summarizing, and detecting patterns across large document collections. It fails at verbatim accuracy, section numbering, and jurisdictional interpretation. Always verify.

Chapter 4 Checklist

- ☐ Identify the top 20 documents your office uses most frequently
- ☐ Convert at least 5 key documents from PDF to structured markdown
- ☐ Establish a file naming convention for your office's knowledge base
- ☐ Create an index file listing all documents in your collection
- ☐ Classify your document collection using the four-level framework
- ☐ Identify your office's Data Protection Officer
- ☐ Test AI with a known legal question and verify the answer against source documents

---

[^1]: Based on the BAA Quick-Reference Index maintained from BTA Parliamentary records. The 89 BAAs are categorized across 13 domains: Budget & Appropriations (18), Local Government (14), Health (13), Electoral (6), Symbols & Identity (6), Social Welfare & Human Rights (6), Governance & Administration (5), Education & Culture (5), Economy & Labor (5), Miscellaneous (5), Peace & Security (3), Environment & Development (2), Human Rights (1).

[^2]: Republic Act No. 11054, "An Act Providing for the Organic Law for the Bangsamoro Autonomous Region in Muslim Mindanao" (2018). Key provisions referenced: Art. V, Sec. 1-3 (Powers of Government); Art. XII, Sec. 15-16 (Annual Block Grant); Art. XIV, Sec. 2 (Special Development Fund); Art. XVI (Transition Provisions). Transition timeline: original 2022 deadline extended by RA 11593 (to 2025) and RA 12064 (to 2028). Priority codes status as of March 2026: four enacted (Administrative Code/BAA 13, Civil Service Code/BAA 17, Education Code/BAA 18, Electoral Code/BAA 35), three remaining (Revenue Code, Local Government Code, Investment Code). Sulu exclusion per *Province of Sulu v. Medialdea*, G.R. Nos. 242255, 243246, 243693 (Sept. 9, 2024; finalized Nov. 26, 2024).

[^3]: Republic Act No. 10173, "An Act Protecting Individual Personal Information in Information and Communications Systems in the Government and the Private Sector, Creating for this Purpose a National Privacy Commission, and for Other Purposes" (2012), otherwise known as the Data Privacy Act of 2012.

[^4]: RA 10173, Sec. 11(a) (Transparency principle for processing of personal information).

[^5]: RA 10173, Sec. 11(b) (Legitimate purpose principle).

[^6]: RA 10173, Sec. 11(c) (Proportionality principle).

[^7]: Anthropic, "Privacy Policy" and "Commercial Terms of Service." As of 2026, Anthropic states that customer data submitted through the API and Team/Enterprise plans is not used for model training. Verify current terms at anthropic.com/privacy.

[^8]: Google, "NotebookLM Privacy and Data Handling." As of 2026, Google states that NotebookLM does not use uploaded sources to train its AI models. Verify current terms at notebooklm.google.com.

[^9]: RA 10173, Sec. 21 (Designation of Data Protection Officer by personal information controllers and processors, including government agencies).

[^10]: Republic Act No. 11054, Art. IX (Basic Rights). The right to information on matters of public concern is a fundamental right recognized under both the BOL and the 1987 Philippine Constitution, Art. III, Sec. 7.

[^11]: Republic Act No. 11054, Art. VII (Bangsamoro Government), provisions on parliamentary transparency and open proceedings.

[^12]: BAA 58 (Parliamentary Districts Creation) and BAA 77 (Reconstituted Parliamentary Districts) were declared unconstitutional by the Supreme Court in *Ali et al. v. BTA* (G.R. No. E-02219) and *Macapaar et al. v. COMELEC* (G.R. No. E-02235; Sept. 30, 2025). BAA 86 (Parliamentary District Act, Jan. 20, 2026) was subsequently enacted, establishing 32 parliamentary districts.

[^13]: Republic Act No. 11054, Art. V, Sec. 2 enumerates 55 subject areas of Bangsamoro government power from (a) administration of justice to (ccc) water supply. Art. V, Sec. 1 contains the residual clause: powers not granted to BARMM vest in the National Government. Art. VI governs intergovernmental relations mechanisms for areas of overlapping authority.

AI for Strategic Planning and Development

Planning is the starting point of the governance cycle. Every peso spent, every program launched, and every outcome measured traces back to a plan. Yet planning in BARMM often proceeds under severe constraints: limited baseline data, compressed timelines, staff stretched across multiple mandates, and a development framework — the 2nd Bangsamoro Development Plan 2023-2028 — that requires alignment across 27 ministries, offices, and agencies. AI does not remove these constraints. It compresses the time between raw information and structured analysis, giving planners room to think instead of drowning in paperwork.

This chapter walks you through how AI supports each stage of the planning cycle. You will learn how to use AI for environmental scanning, development plan formulation, Theory of Change design, and data-driven needs assessment. You will also learn where AI falls short — the decisions no algorithm should make.

> **Cross-reference:** This chapter complements the *Strategic Planning Guidebook for the Bangsamoro Government*, which provides the full 10-Point Strategic Planning Framework for ministries, offices, and agencies.[^1] That guidebook gives you the methodology. This chapter gives you AI-powered tools to execute each step faster and with richer analysis.

5.1 AI in the Planning Cycle

Strategic planning in BARMM follows a cycle. The 2nd BDP describes it as a hierarchy of results: **vision and mission** at the top, six **development goals** in the middle, eight **development strategies** linking goals to action, and **programs, projects, and activities (PPAs)** at the base.[^2] Each ministry translates this hierarchy into its own strategic plan, annual investment program, and budget proposal.

AI enters this cycle at every stage — but contributes differently at each one.

Where AI Adds Value in the Planning Cycle

Planning Stage	What You Do	What AI Can Do	What AI Cannot Do
Environmental scanning	Assess external forces, internal capacity,	Synthesize large datasets; detect patterns across documents; draft	Judge which factors matter most to your community

Planning Stage	What You Do	What AI Can Do	What AI Cannot Do
	stakeholder landscape	SWOT/PESTEL frameworks	
Situational analysis	Diagnose the current state of your sector	Summarize baseline data; compare BARMM indicators against national benchmarks	Explain *why* indicators are where they are — that requires field knowledge
Goal and strategy formulation	Set direction for your ministry or office	Draft vision/mission statements; align proposed PPAs with BDP goals; flag mandate gaps	Decide which goals deserve priority given political and cultural realities
Theory of Change design	Map the causal logic from activities to outcomes	Generate ToC diagrams; identify missing assumptions; pressure-test logical chains	Validate whether assumptions hold in Bangsamoro communities
Needs assessment	Determine what communities actually require	Analyze survey data; identify underserved populations; cross-reference supply against demand	Replace community consultation and field validation
Plan documentation	Write the strategic plan document	Draft sections, format tables, ensure internal consistency	Guarantee that the document reflects organizational consensus

Notice the pattern. **AI handles analysis and drafting speed. You handle judgment, context, and community knowledge.** A ministry planner who uses AI can produce a first-draft situational analysis in a day rather than a week. But the planner still validates every finding against field reality, stakeholder input, and political feasibility.

The BDP as Your AI Context Document

The single most valuable document to give your AI tool when doing planning work is the **2nd Bangsamoro Development Plan 2023-2028**. Upload the full plan — or at minimum, Chapter 4 (Development Framework) — before starting any planning prompt. This gives AI the six development goals, eight strategies, macroeconomic targets, and the alignment framework that every BARMM plan must follow.[^2]

Without the BDP loaded, AI will generate planning outputs based on generic development frameworks. Those outputs may sound professional but will miss BARMM's specific goals: moral governance, the Enhanced 12-Point Priority Agenda, vertical alignment with the PDP 2023-2028, and horizontal alignment with the Bangsamoro Development and Investment Program (BDIP).

5.2 Environmental Scanning and Situational Analysis with AI

Environmental scanning answers the question: **What forces shape your ministry's operating environment?** Situational analysis answers: **Where do you stand right now?** Both require processing large volumes of information from diverse sources. This is exactly where AI excels.

SWOT Analysis with AI

SWOT (Strengths, Weaknesses, Opportunities, Threats) remains the most common environmental scanning tool in BARMM government planning. Most offices produce one annually. The problem is not the framework — it is the time required to compile evidence for each quadrant.

Use AI as your evidence compiler. Feed it your office's key documents and let it populate the SWOT matrix with specific, grounded findings.

Sample prompt — SWOT analysis for a ministry:

```
You are a strategic planning analyst for [Ministry Name] in the
Bangsamoro Autonomous Region in Muslim Mindanao (BARMM).

TASK: Conduct a SWOT analysis based on the documents provided.

DOCUMENTS PROVIDED:
- [Ministry Name] Manual of Operations
- [Ministry Name] FY 2025 Annual Report
- 2nd Bangsamoro Development Plan 2023–2028, Chapter 4
  (Development Framework)
- BAA 13 (Bangsamoro Administrative Code), provisions on
  [Ministry Name]
- [Ministry Name] FY 2026 Budget Proposal

INSTRUCTIONS:
1. Identify 5–8 items per SWOT quadrant.
2. Ground every item in a specific fact from the documents —
   cite the source document and section.
3. Distinguish between internal factors (Strengths/Weaknesses)
   and external factors (Opportunities/Threats).
4. Flag any finding where you are uncertain about the evidence.
5. Format as a 4-quadrant table.

CONSTRAINTS:
- Do not invent programs, data, or statistics not found in
  the provided documents.
- Do not use generic language like "limited resources" unless
  you can point to a specific budget figure or staffing gap.
```

What to do with the output: AI will return a well-structured SWOT table. Your job is to:

1. **Verify each item.** Does the source document actually say what AI claims? Check the citation.
2. **Add field knowledge.** AI cannot know that your regional office in Tawi-Tawi has been understaffed since 2024 because two division chiefs transferred to MILG. Add what you know.
3. **Prioritize.** AI lists items without ranking them. Your planning team decides which strengths to leverage, which weaknesses to address first, and which threats require contingency plans.

PESTEL Analysis with AI

PESTEL (Political, Economic, Social, Technological, Environmental, Legal) provides a wider lens than SWOT. It captures external forces that affect your ministry but lie outside your control.

PESTEL is particularly useful for BARMM planning because the region operates within a complex political environment: the BTA transition, the 2028 elections, overlapping national and regional jurisdictions, and the peace and normalization process.

Use AI to scan multiple documents simultaneously and populate the PESTEL matrix:

- **Political:** Feed AI the BOL transition provisions, executive orders on Sulu realignment, and election-related legislation. Ask it to identify political factors affecting your sector over the next 3 years.
- **Economic:** Feed AI the BDP macroeconomic targets (GRDP growth of 8-9%, poverty reduction to 20-25%, industry/services growth of 10-12%) and your sector's economic data.[^3] Ask it to identify economic trends relevant to your ministry.
- **Social:** Feed AI community survey data, demographic reports, and social development indicators for BARMM.
- **Technological:** Ask AI to identify technology trends relevant to your sector — digital government services, GIS mapping, electronic health records.
- **Environmental:** Feed AI climate vulnerability assessments and disaster risk reduction plans for your area of operations.
- **Legal:** Feed AI the 89 enacted BAAs and ask it to identify legislative changes that affect your mandate. Use the BAA index from Chapter 4 of this guidebook as a reference.[^4]

Stakeholder Mapping with AI

Every BARMM ministry operates within a web of stakeholders: the Parliament, the Office of the Chief Minister, national government agencies, local government units, development partners, civil society organizations, and the communities themselves.

AI can help you build a **stakeholder influence-interest matrix** by analyzing your mandate documents and identifying every entity mentioned. Feed AI your enabling law (the BAA or Executive Order that created or empowered your ministry), your MOP, and your recent committee reports. Ask it to:

1. List every organization, office, or group mentioned.
2. Classify each by influence (high/low) and interest (high/low).

3. Flag stakeholders with overlapping mandates.

You then validate the matrix. AI will not know that the provincial governor has been an active champion of your program, or that a particular development partner has shifted its funding priorities. Add this knowledge manually.

From Scan to Strategy: The Iterative Prompting Approach

A single prompt rarely produces a complete environmental scan. Use **iterative prompting** — a series of prompts that progressively deepen the analysis.

Round 1 — Broad scan. Ask AI to identify all external and internal factors based on the documents you provided. Accept a wide net. The output may have 30-40 items across all SWOT or PESTEL categories.

Round 2 — Evidence grounding. Take the Round 1 output and ask AI: *"For each item, cite the specific document section that supports it. Remove any item you cannot ground in the provided documents."* This eliminates generic filler. You typically lose 30-40% of items here — the ones AI inferred from general knowledge rather than your specific documents.

Round 3 — Prioritization support. Ask AI to rank the remaining items by potential impact on your ministry's ability to deliver its mandate over the next three years. AI's ranking will not be authoritative — but it gives your planning team a starting point for discussion rather than a blank whiteboard.

Round 4 — Implication drafting. For the top five items in each category, ask AI: *"Draft a one-paragraph strategic implication for [Ministry Name]. What does this factor mean for our planning over 2026-2028?"* These paragraphs become the narrative backbone of your situational analysis section.

This four-round approach takes two to three hours with AI. Without AI, the same depth of analysis requires one to two weeks of staff time compiling and cross-referencing documents manually.

Common Pitfalls in AI-Assisted Environmental Scanning

Watch for these recurring errors:

Pitfall	What Happens	How to Fix It
Generic weakness statements	AI writes "limited human resources" without specifying *which* positions,	Require AI to cite a specific number or document section for every weakness

Pitfall	What Happens	How to Fix It
	how many vacancies, or *where*	
Optimistic threat assessment	AI downplays political risks or security concerns because its training data favors neutral language	Explicitly ask: "What political or security risks could disrupt this ministry's operations in the next 2 years?"
Missing the BTA transition context	AI treats BARMM as a permanent government structure, ignoring the 2028 election transition and its implications	Add this to your prompt context: "The BTA is a transition authority. Elections for the first regular government are scheduled for 2028. The transition creates both opportunities and uncertainties for institutional continuity."
Confusing national and regional jurisdiction	AI attributes powers to BARMM that belong to national agencies, or vice versa	Cross-check every jurisdictional claim against BOL Article V (Powers of Government)

5.3 AI-Assisted Development Plan Formulation

Once you understand your environment, you formulate the plan itself. This means drafting your vision and mission, aligning your programs with BDP goals, and identifying gaps in your mandate coverage. AI accelerates each step.

5.3.1 Vision and Mission Drafting

The BARMM vision is clear: *"A Bangsamoro that is united, enlightened, self-governing, peaceful, just, morally upright, and progressive."*[^2] The mission emphasizes **moral governance**, **genuine and meaningful autonomy**, **enduring peace**, and **sustained socioeconomic development** through services, multi-stakeholder participation, and partnership.[^2]

Every ministry's vision and mission must connect to these regional statements. AI helps you draft ministry-level versions that maintain alignment while reflecting your sector's specific identity.

How to prompt for vision/mission drafting:

1. **Provide the BDP vision and mission** as reference text in your prompt.
2. **Provide your ministry's mandate** — the specific functions assigned to you by the BAA or EO.
3. **Specify the audience** — who will read this vision statement? Staff? Partners? Communities?
4. **Ask AI to generate 3-5 draft options** rather than a single version. This gives your planning team choices to discuss and refine.

What to watch for: AI tends to produce vision statements that are either too generic ("to be a world-class ministry of education") or too ambitious ("to eliminate poverty in the Bangsamoro by 2028"). Push back. Ask AI to ground every element of the vision in your mandate and current capacity. A good vision statement is aspirational *and* achievable within the planning period.

The revision cycle matters. Do not accept the first draft. Use AI iteratively:

1. **First draft:** AI generates 3-5 vision options based on your mandate and the BDP.
2. **Your feedback:** "Option 3 is closest, but it does not reflect our mandate in disaster resilience. Revise to include this."

3. **Second draft:** AI refines Option 3, incorporating your feedback.
4. **Team review:** Share the revised draft with your planning team. Collect their input.
5. **Final revision:** Feed the team's comments back to AI for a polished version.

This cycle mirrors how you would work with a human drafting consultant — except the turnaround between drafts drops from days to minutes.

> **Cross-reference:** The *Strategic Planning Guidebook* covers vision and mission formulation under Planning Point 3 (Organizational Direction Setting), with step-by-step instructions and a worked example for a BARMM ministry.[^1]

5.3.2 Aligning PPAs with BDP 2023-2028 Goals

This is the most technically demanding planning task — and the one where AI provides the greatest time savings. Every ministry must demonstrate that its **programs, projects, and activities (PPAs)** contribute to one or more of the six BDP development goals.

The 2nd BDP's six goals and their AI-assisted planning applications:

BDP Goal	Description	AI-Assisted Planning Tasks
Goal 1	Stable, just, and accountable government	Map institutional strengthening PPAs to governance indicators; compare accountability mechanisms against BAA 13 (Administrative Code) requirements; analyze staffing gaps using plantilla data
Goal 2	Equitable, competitive, and robust economy	Cross-reference economic PPAs against macroeconomic targets (8-9% GRDP growth, 10-12% industry/services growth); identify investment gaps using BDP baseline data; benchmark BARMM economic indicators against national averages
Goal 3	Peaceful, safe, and resilient Bangsamoro communities	Analyze peace and security PPAs against conflict data; map community resilience

BDP Goal	Description	AI-Assisted Planning Tasks
		programs to climate vulnerability assessments; cross-reference with normalization commitments
Goal 4	Inclusive, responsive, and quality social services	Compare social service coverage against population data; identify underserved municipalities; analyze PPA beneficiary targeting against poverty incidence by province (baseline: 29.80% in 2021, target: 20-25%)[^3]
Goal 5	Rich and diverse Bangsamoro culture and identity preserved and recognized	Map cultural preservation PPAs to BOL Article IX cultural rights provisions; identify IP communities and cultural heritage sites requiring targeted programs
Goal 6	Strategic, adequate, and climate-resilient infrastructure	Analyze infrastructure PPAs against connectivity gaps; cross-reference with climate vulnerability data; compare infrastructure budget allocation against BDP targets for capital formation (18-20% of GRDP)[^3]

How to use this table: Feed AI your ministry's PPA list and the BDP chapter relevant to your sector. Ask AI to map each PPA to one or more BDP goals, identify PPAs that do not clearly support any BDP goal, and flag BDP targets that your ministry's PPAs do not address.

Sample prompt for PPA-BDP alignment:

```
You are a development planner for [Ministry Name] in BARMM.

TASK: Map our ministry's PPAs to the 2nd BDP 2023–2028 goals.

DOCUMENTS PROVIDED:
- [Ministry Name] PPA list for FY 2026 (pasted below)
- 2nd BDP 2023–2028, Chapter 4 (Development Framework)
- [Ministry Name] enabling legislation

INSTRUCTIONS:
1. For each PPA, identify which BDP goal(s) it supports.
2. Rate the alignment as Strong, Moderate, or Weak with a
   one-sentence justification.
3. Identify any PPAs with no clear BDP alignment.
4. Identify BDP goals that your ministry should support but
   has no PPAs addressing.
5. Format as a table: PPA | BDP Goal | Alignment Rating |
   Justification.
```

This alignment exercise — done manually — typically takes a planning team three to five working days. With AI, you produce a first-draft alignment matrix in an afternoon. The planning team then spends its time on the higher-value work: debating alignment ratings, filling genuine gaps, and making trade-offs between competing priorities.

The Eight Development Strategies as a Secondary Alignment Layer

The BDP's six goals tell you *what* BARMM aims to achieve. The eight development strategies tell you *how*. Many ministries align PPAs to goals but overlook strategy alignment. This creates a gap between what you aim to achieve and the approach you take to get there.

The eight strategies are:[^2]

1. Improve and strengthen governance mechanisms
2. Create an enabling environment for economic growth
3. Harness technology and innovations
4. Improve ecological integrity and community resilience
5. Enhance peace, public order, safety, and security
6. Ensure inclusive and equitable access to quality services
7. Mainstream Bangsamoro cultural diversity and identity
8. Scale up functional, strategic, climate-resilient infrastructure

Ask AI to perform a **dual alignment check**: map each PPA to both a BDP goal *and* one or more strategies. This reveals PPAs that support a goal in principle but follow no defined strategy — a common sign that the program was designed in isolation rather than within the BDP framework.

Strategy 3 (harness technology and innovations) deserves special attention in an AI-focused guidebook. Any ministry that adopts AI tools for planning, analysis, or service delivery directly advances this strategy. When your office uses AI to produce a needs assessment or draft a legislative briefer, you are not just working more efficiently — you are operationalizing the BDP's technology strategy. Document this in your strategic plan.

5.3.3 Identifying Gaps in Mandate Coverage

Every BARMM ministry has a **legal mandate** — the functions and powers assigned by law. And every ministry has a **current program portfolio** — the PPAs it actually implements. The gap between mandate and portfolio is a planning problem. Some mandated functions may have no corresponding program. Some programs may lack clear mandate authority.

AI is effective at detecting these gaps because the task is fundamentally a comparison exercise:

1. **Feed AI your enabling legislation** — the BAA or Executive Order that defines your ministry's functions.
2. **Feed AI your current PPA list.**
3. **Ask AI to match each mandated function to one or more PPAs, and flag any unmatched functions.**

The output is a **mandate coverage matrix** showing which functions are fully covered, partially covered, or uncovered. This matrix becomes the basis for expanding your program portfolio in the next planning cycle.

Example: The **Ministry of Basic, Higher, and Technical Education (MBHTE)** has mandated functions spanning basic education, higher education, technical-vocational training, and madaris education. If AI detects that the MBHTE's current PPAs heavily cover basic education and higher education but have minimal programs for madaris quality assurance — despite the BOL mandate under Article IX, Section 24[^5] — that gap becomes a planning priority.

> **Cross-reference:** The *Strategic Planning Guidebook* provides step-by-step instructions for mandate gap analysis under Planning Point 1 (Legal Alignment), including a worked example and a Legal Mandate Inventory template.[^1]

5.4 Theory of Change Design with AI

A **Theory of Change (ToC)** maps the causal logic of your program: *If we do X activities, they will produce Y outputs, which will lead to Z outcomes, which will contribute to the BDP goal.* Every link in the chain rests on an **assumption** — a condition that must hold true for the causal logic to work.

Most government plans skip the ToC or treat it as a post-hoc justification. This is a mistake. Without a ToC, you cannot explain *why* your programs should produce results, and you cannot design a monitoring system that tests whether they actually do.

AI helps with ToC design in three ways.

Generating the Initial ToC Structure

Describe your program to AI and ask it to produce a ToC in structured format. AI will generate a chain from activities to outputs to outcomes to impact, with assumptions at each transition.

Sample prompt:

```
You are a development planner designing a Theory of Change.

PROGRAM: [Program Name] under [Ministry Name], BARMM.

OBJECTIVE: [State the program objective and its connection
to BDP Goal X].

ACTIVITIES: [List the program's main activities].

TASK: Design a Theory of Change with the following structure:
1. Activities (what we do)
2. Outputs (what we produce directly)
3. Short-term outcomes (changes within 1 year)
4. Medium-term outcomes (changes within 2-3 years)
5. Long-term outcome / Impact (contribution to BDP goal)
6. Assumptions at each transition (what must be true for
   the link to hold)
7. External factors that could disrupt the chain.

Format as a structured list, not a paragraph.
```

A Concrete Example: ToC for a Livelihood Program

Consider a livelihood program under the **Ministry of Trade, Investments, and Tourism (MTIT)** aimed at BDP Goal 2 (Equitable, Competitive, and Robust Economy). You describe the program to AI: "A livelihood skills training program for 500 out-of-school youth in conflict-affected municipalities of Maguindanao del Sur, providing 6-month technical-vocational training in agri-processing and digital skills, followed by enterprise startup support."

AI generates a structured ToC:

Activities: - Recruit and screen 500 out-of-school youth from conflict-affected municipalities - Deliver 6-month technical-vocational training in agri-processing and digital skills - Provide PHP 50,000 enterprise startup grants per graduate - Connect graduates to market linkages and cooperative networks

Outputs: - 500 youth enrolled and trained - 400 graduates who complete the full program (80% completion target) - 300 enterprise startup grants disbursed

Short-term outcomes (Year 1): - 200 graduates establish micro-enterprises or join existing cooperatives - Average monthly income of participating youth increases from PHP 3,000 to PHP 8,000

Medium-term outcomes (Years 2-3): - 60% of micro-enterprises remain operational after 24 months - Employment and income gains reduce youth vulnerability to recruitment by armed groups - Local agri-processing output increases in target municipalities

Long-term impact: - Contribution to BDP Goal 2 macroeconomic targets: reduced underemployment (target: 4-7%) and poverty incidence (target: 20-25%)

Assumptions (where AI identifies risk): - *Assumption 1:* Trained youth have access to raw agricultural inputs for agri-processing. *Risk: Supply chain disruptions in conflict-affected areas.* - *Assumption 2:* Local market demand absorbs additional agri-processed products. *Risk: Market saturation if multiple programs target the same products.* - *Assumption 3:* Security conditions permit youth to travel to training centers and operate businesses. *Risk: Recurrence of armed conflict disrupts activities.* - *Assumption 4:* PHP 50,000 is sufficient seed capital for a viable micro-enterprise. *Risk: Inflation or input cost increases may require higher capitalization.*

This draft is not final. It is a starting point your planning team refines. But the structure took AI ten minutes to produce. Without AI, drafting this level of detail typically takes a two-day workshop.

Pressure-Testing Assumptions

This is where AI becomes a genuine thinking partner. Once you have a draft ToC, ask AI to challenge each assumption:

- "What evidence supports the assumption that training local health workers will reduce maternal mortality in island municipalities?"
- "Under what conditions would this assumption fail?"
- "What alternative explanations exist for the expected outcome?"

AI draws on general development knowledge to identify weak links. Your team then decides whether to strengthen the assumption (by adding a supporting activity), accept the risk, or redesign the chain.

Identifying Missing Pathways

Ask AI: *"What outcomes does this program likely produce that are not captured in the current ToC?"* AI may identify **unintended effects** — both positive and negative — that your team has not considered. A livelihood program may unintentionally increase school dropout rates if youth see immediate income as more attractive than completing secondary education. A road construction project may increase land values, displacing low-income families near the construction corridor. AI flags these possibilities. Your team investigates whether they are realistic in your specific context.

You can also use AI to identify **enabling conditions** that are not part of your program but are necessary for success. Ask: *"What programs or policies from other BARMM ministries must be in place for this ToC to work?"* This reveals **inter-ministry dependencies** — a common source of program failure in BARMM, where one ministry designs a program assuming that another ministry will deliver a prerequisite service. If the MTIT livelihood program above assumes that MBHTE has already trained the youth in basic literacy, but MBHTE's literacy programs do not reach the target municipalities, the entire ToC breaks at the first link. AI helps you map these dependencies. Your planning team then coordinates with the relevant ministries.

> **Caution:** AI generates plausible-sounding causal chains with ease. Plausibility is not validity. Every ToC link must be tested against local evidence, community feedback, and your sector expertise. AI gives you the structure. You provide the ground truth.

5.5 Data-Driven Needs Assessment

A **needs assessment** determines the gap between what communities have and what they require. It drives program design, resource allocation, and targeting decisions. In BARMM, needs assessments face a persistent challenge: **data scarcity**. Some municipalities lack recent population surveys. Health and education data may be incomplete for conflict-affected areas. Disaggregated data by province, age, sex, and disability status is often unavailable.

AI does not create data that does not exist. But it maximizes the value of data you do have.

What AI Can Do for Needs Assessment

Synthesize multiple data sources. Feed AI your ministry's performance reports, PSA statistical data for BARMM, LGU-level survey results, and development partner assessments. Ask it to identify municipalities or barangays that appear underserved across multiple indicators. The cross-referencing is what takes human analysts weeks. AI does it in minutes.

Identify patterns in service delivery gaps. If you have data on health facility locations, population density, and travel time estimates, AI can identify communities that are geographically isolated from basic services. Ask AI: *"Which municipalities in Maguindanao del Sur have the highest ratio of population to health facilities?"*

Compare supply against demand. Feed AI your inventory of programs and facilities (supply) and your population data with need indicators (demand). Ask it to produce a supply-demand gap table by municipality.

Analyze qualitative data. If your ministry conducts community consultations, feed AI the meeting minutes or transcripts. Ask it to extract and categorize the most frequently raised needs, disaggregated by location or sector.

Design data collection instruments. When existing data is insufficient, ask AI to draft survey questionnaires, key informant interview guides, or focus group discussion protocols. Provide AI with your ministry's mandate, the specific BDP targets you are assessing against, and the target population. AI produces a first-draft instrument in minutes. Your team reviews it for cultural appropriateness, language suitability (many BARMM communities are most comfortable in Maguindanaon, Maranao, Tausug, or Sama), and field feasibility.

Sample prompt for needs assessment data synthesis:

```
You are a planning analyst for [Ministry Name] in BARMM.

TASK: Synthesize data from the attached documents to identify
the top service delivery gaps across BARMM's provinces.

DOCUMENTS PROVIDED:
- [Ministry Name] Annual Report FY 2025
- PSA BARMM Quickstat (latest available)
- BDP 2023–2028, Chapter [X] with sector targets
- LGU compliance monitoring reports

INSTRUCTIONS:
1. For each province and city, compare current service coverage
   against BDP targets.
2. Rank provinces by severity of gap (target minus actual).
3. Identify municipalities that appear underserved across
   two or more indicators.
4. Flag any province where data is missing or outdated.
5. Present findings as a gap analysis table: Province |
   Indicator | BDP Target | Current Value | Gap | Data Source.

CONSTRAINTS:
- If data for a province is missing, mark it as "No data
  available" — do not estimate or extrapolate.
- Cite the specific page or table from the source document
  for every data point.
```

How AI Changes the Needs Assessment Timeline

Without AI, a comprehensive sectoral needs assessment follows this typical timeline:

Step	Manual Process	Time Required	With AI	Time Required
Data compilation	Staff gathers reports from provincial offices, extracts figures into spreadsheets	5-10 working days	Upload all reports to AI in one session	1-2 hours
Cross-referencing	Staff manually compares	3-5 working days	AI cross-references and	30 minutes

Step	Manual Process	Time Required	With AI	Time Required
	figures across documents, checks for inconsistencies		flags discrepancies	
Gap identification	Staff calculates gaps between targets and actuals for each indicator and area	2-3 working days	AI produces gap analysis table with rankings	15 minutes
Report drafting	Staff writes the narrative situational analysis	3-5 working days	AI drafts narrative; staff revises and validates	1 day
Total		**13-23 working days**		**2-3 working days**

The time savings are dramatic — but the accuracy verification step does not compress. Every figure AI produces must be checked against source documents. The 2-3 days with AI include roughly one full day of human verification. Skip that day and you risk submitting a needs assessment with wrong numbers. Wrong numbers in a budget proposal become wrong allocations in the appropriations act.

Case Study: AI-Assisted Needs Assessment for the Ministry of Health (MOH)

Scenario: The MOH planning division is preparing its FY 2027 budget proposal and needs a situational analysis of maternal and child health service delivery across BARMM's five provinces and three cities.

Data available: - MOH Annual Report FY 2025 (facility utilization, staffing levels by hospital) - PSA population data for BARMM (2020 Census with 2025 projections) - Field Health Service Information System (FHSIS) data for rural health units - BDP 2023-2028, Chapter 6 (Social Development) with maternal health targets - List of 13 health-related BAAs, including hospital upgrade legislation

What the planning team did:

1. **Loaded all five documents** into the AI tool as context.
2. **Prompted AI** to cross-reference facility utilization rates against population data to identify provinces where demand exceeds capacity.
3. **Prompted AI** to compare current staffing levels against Department of Health staffing standards for each facility type.
4. **Prompted AI** to map the 13 health BAAs against the provinces they cover and identify geographic gaps — provinces without hospital upgrade legislation.
5. **Prompted AI** to produce a summary table ranking provinces by severity of maternal health service gaps.

Result: AI produced a draft situational analysis in three hours that identified two provinces with facility utilization rates above 120% of capacity, three municipalities with zero registered midwives, and one geographic cluster of island barangays in Tawi-Tawi where no BAA had authorized facility upgrades. The planning team validated these findings against field reports, corrected two facility counts that AI had misread, and used the analysis as the evidence base for the FY 2027 budget proposal.

What AI could not do: AI could not determine whether the facility utilization data reflected actual patient volume or incomplete reporting. It could not explain why three municipalities had zero midwives — whether due to unfilled plantilla positions, deployment preferences, or security concerns. The planning team conducted follow-up interviews with provincial health officers to fill these gaps.

The Limits of Data-Driven Needs Assessment

AI-powered needs assessment works only when data exists. For many BARMM communities — particularly in geographically isolated and disadvantaged areas (GIDA) — reliable recent data may not be available. When this is the case:

- **Say so explicitly.** Use AI to identify *where data gaps exist* rather than forcing analysis from incomplete data.
- **Use AI to design data collection instruments.** Ask AI to draft a community needs survey, a facility assessment checklist, or a key informant interview guide based on your ministry's mandate and BDP targets.
- **Triangulate.** When one data source is weak, AI can help you identify alternative sources. If municipal-level health data is incomplete, ask AI to cross-reference with school enrollment data (proxy for child population), LGU budget data (proxy for local investment in health), and development partner project locations.

5.6 Limitations: What Planning Decisions AI Cannot Make

AI processes information. It does not govern. The following planning decisions require human judgment that no AI tool can replicate:

Political Prioritization

Your ministry may identify 15 legitimate needs, but the budget supports only five programs. Which five? That decision involves **political feasibility**, **stakeholder dynamics**, and **coalition building** — none of which AI can assess. A minister who decides to prioritize Tawi-Tawi infrastructure over Lanao del Sur livelihood programs may be responding to a political commitment made during a parliamentary session, a field visit that revealed urgent conditions, or a directive from the Office of the Chief Minister. AI does not attend these meetings.

Cultural Sensitivity

BARMM planning operates within a cultural context that values **community consultation (shura)**, **consensus-building**, and **respect for traditional governance structures**. A plan that is technically optimal but bypasses the ulama consultation on education policy, or ignores the role of traditional leaders in conflict resolution, will fail regardless of the data supporting it. AI knows nothing about your community's leadership dynamics.

Value Trade-Offs

The BDP itself embodies value choices. Goal 5 (cultural preservation) may sometimes tension with Goal 2 (economic competitiveness). Goal 3 (peace and resilience) may require investments that do not show economic returns for a decade. These are not analytical questions — they are governance questions. AI can lay out the trade-offs. Your leadership must choose.

Moral Governance Alignment

The 2nd BDP places **moral governance** at the center of BARMM's leadership framework, operationalized through twelve pillars: integrity, accountability, transparency and honesty, sense of patriotism, striving for excellence, cultural understanding and tolerance, unwavering loyalty to God, justice, inclusivity, objectivity, dialogue and meaningful engagement, and balance between practical life and the moral side.[^6] These are not met-

rics AI can optimize. They are principles that require human leaders to exercise *judgment* about whether a plan serves the public good, reflects community values, and upholds the trust placed in government.

Stakeholder Consensus

A strategic plan is only as useful as the organizational commitment behind it. A technically excellent plan that division chiefs did not help build, that beneficiary communities were not consulted on, and that the budget office was not briefed about will sit on a shelf. AI can draft the plan document. **Only your team can build the consensus to implement it.**

Institutional Memory and the 2028 Transition

BARMM faces a unique planning constraint. The BTA is a transition authority. The first regular government elections are scheduled for 2028. Every plan developed now must account for institutional continuity: **Will the programs survive a change in leadership?** AI cannot answer this question. But you can use AI to *document* the strategic logic behind every program — the ToC, the alignment to BDP goals, the needs assessment evidence — so that incoming officials have a clear record of *why* programs exist, not just *what* they do. Well-documented plans are harder to discard arbitrarily. AI helps you build that documentation layer quickly and comprehensively. The continuity, however, depends on whether your ministry creates organizational systems to preserve and transmit these plans — a human decision, not an algorithmic one.

Key Takeaways

1. **AI compresses planning time, not planning judgment.** Use AI to produce first-draft environmental scans, alignment matrices, and needs assessments in hours instead of weeks. Use your team's time for the higher-value work: validating findings, debating priorities, and building consensus.
2. **Load the BDP before every planning prompt.** The 2nd BDP 2023-2028 is your AI context anchor. Without it, AI outputs will default to generic development frameworks that miss BARMM's specific goals, strategies, and macroeconomic targets.
3. **Map PPAs to BDP goals systematically.** The six-goal, eight-strategy framework of the BDP gives you a structured alignment test for every program in your portfolio. AI can produce the first-draft alignment matrix. Your team refines it.
4. **Use Theory of Change to expose weak assumptions.** AI generates plausible causal chains. Your job is to pressure-test each assumption against field reality. A ToC with untested assumptions is decoration, not planning.
5. **AI cannot replace community voice.** Needs assessments, stakeholder consultations, cultural considerations, and political prioritization require human presence, relationship, and judgment. AI processes documents. You serve communities.
6. **Name the gaps honestly.** When data does not exist, say so. Use AI to identify where data gaps are — then invest in collecting the data rather than forcing AI to analyze what is not there.

Chapter 5 Checklist

- ☐ Upload the 2nd BDP 2023-2028 (Chapter 4 at minimum) as context for all planning prompts
- ☐ Produce an AI-assisted SWOT analysis for your ministry and validate every item against source documents
- ☐ Map your ministry's PPAs to the six BDP development goals using the alignment prompt template
- ☐ Identify at least one mandate gap — a function assigned by law that has no corresponding PPA
- ☐ Draft a Theory of Change for one priority program and pressure-test its assumptions with AI
- ☐ Conduct an AI-assisted needs assessment for one sector using at least three data sources
- ☐ Share AI-generated planning outputs with your team for validation before incorporating into official plans

AI for Budgeting and Financial Analysis

The Bangsamoro Government manages a budget exceeding PHP 114 billion for FY 2026.[^1] That budget flows through a four-phase cycle — preparation, authorization, execution, and accountability — codified in the Bangsamoro Budget System Act.[^2] Every phase generates documents: budget proposals, committee reports, allotment orders, disbursement authorities, financial accountability reports. Every document contains numbers that must be checked, compared, and explained.

This is where AI earns its place. AI does not make budget decisions. It does not sign allotment orders. But it can compare this year's appropriations against last year's in seconds. It can flag a ministry whose **Personnel Services** allocation exceeds the 45% ceiling. It can draft a budget briefer that would take a staff analyst two days in under two hours. You still verify every number. You still apply judgment. AI handles the volume.

This chapter walks you through the entire budget cycle and shows you exactly where AI enters, what prompts to use, and what to verify before you sign anything.

6.1 The Bangsamoro Budget Cycle and Where AI Enters

BAA 84 establishes a **planning-programming-budgeting continuum** that links the Bangsamoro Development Plan to annual budget allocations.[^3] The cycle has four distinct phases. Each phase has specific documents, deadlines, and decision points. AI can assist in every phase — but the nature of its assistance changes.

The Budget Cycle at a Glance

Phase	Key Activities	Key Documents	BAA 84 Sections	AI Entry Points
Preparation	BBCC sets fiscal strategy; M/O/As submit proposals; MFBM evaluates	Budget Call, Budget Proposals, Budget Priorities Framework, BESF	Secs. 14-25	Draft proposals, check BDP alignment, compare year-over-year figures
Authorization	Parliament deliberates GABB; committee	General Appropriations Bill, Committee	Secs. 26-33	Analyze bill provisions, prepare committee

Phase	Key Activities	Key Documents	BAA 84 Sections	AI Entry Points
	reviews; plenary votes	Reports, Amendments		briefers, compare proposed vs. prior-year allocations
Execution	MFBM releases allotments; M/O/As obligate and disburse	GAABAO, SARO, BEDs, Financial Plans, Procurement Plans	Secs. 34-51	Track obligation rates, flag under-spending, draft quarterly reports
Accountability	M/O/As submit BFARs; COA audits; Parliament reviews	BFARs, COA Reports, Annual Accomplishment Reports	Secs. 60-67	Analyze audit findings, compare planned vs. actual performance, draft compliance reports

The table above is your reference map. Whenever someone assigns you a budget task, locate it in one of these four phases first. The phase determines what documents you need and what kind of AI assistance is appropriate.

6.1.1 Budget Preparation

Budget preparation begins when the **Bangsamoro Budget Coordinating Committee (BBCC)** presents the Budget Priorities Framework to the Chief Minister and Cabinet in April of each year.[^4] The MFBM then issues the annual **Budget Call**, which prescribes the process, forms, and calendar for all M/O/As to follow.[^5]

What happens in this phase:

- The BBCC reviews macroeconomic targets, revenue projections, and expenditure priorities
- M/O/As prepare and submit budget proposals showing organizational outcomes, performance indicators, and cost estimates

- **Budget Endorsing Authorities** review and endorse proposals for compliance with technical standards
- The MFBM evaluates proposals against six criteria: alignment with the Chief Minister's priority agenda, past performance, implementation readiness, program convergence, available funding sources, and other MFBM criteria[^6]
- The Chief Minister submits the **Proposed Bangsamoro Budget** to Parliament by September 30[^7]

Where AI enters:

Use AI to **draft budget proposals** that link each program, activity, and project (P/A/P) to the Bangsamoro Development Plan. BAA 84 explicitly requires this linkage.[^8] Feed the AI your ministry's mandate, the BDP 2023-2028 goals, and your proposed P/A/Ps. Ask it to draft the narrative justification showing how each P/A/P advances specific BDP strategies.

Use AI to **compare your current proposal against prior-year budgets**. Paste your proposed figures alongside last year's enacted amounts. The AI can calculate percentage changes, flag items that increased or decreased by more than 20%, and draft explanations for significant variances.

Use AI to **check compliance with the Budget Priorities Framework**. The framework mandates that the highest budgetary priority go to education, health, and social services. It also requires that at least 5% of each M/O/A's appropriation be allocated for **gender-responsive programs**.[^9] Ask the AI to scan your proposal and verify these requirements are met.

> **Sample Prompt — Budget Proposal Drafting:**
>
> ``` You are a budget analyst for [Ministry Name] in the Bangsamoro Government.
>
> Draft a budget proposal narrative for FY [Year] that covers: 1. Organizational outcomes and performance indicators 2. Linkage of each P/A/P to the BDP 2023-2028 (specify which BDP goal and strategy each P/A/P supports) 3. Estimated expenditures by allotment class (PS, MOOE, CO) with comparative data for the preceding and current fiscal years 4. Brief description of major thrusts and priority programs
>
> Use the following data: [Paste your ministry's proposed programs, prior-year figures, and relevant BDP goals]
>
> Follow BAA 84, Section 19 requirements for budget proposals. Do not fabricate figures. Mark any estimate without a source as [ESTIMATE - VERIFY]. ```

6.1.2 Budget Authorization

Authorization begins when the Chief Minister submits the Proposed Bangsamoro Budget to Parliament. The **General Appropriations Bill of the Bangsamoro (GABB)** must be filed and calendared for first reading within five calendar days. The committee must submit its report within 60 calendar days from referral. Plenary debate and amendments must conclude within 30 calendar days after that.[^10]

What happens in this phase:

- The Committee on Finance, Budget and Management (CFBM) conducts detailed review
- Members of Parliament examine ministry-by-ministry appropriations
- Committee hearings produce questions, amendments, and recommendations
- The plenary debates and votes on the GABB
- The enacted budget becomes the **General Appropriations Act of the Bangsamoro (GAAB)**

Where AI enters:

Use AI to **prepare committee briefers** for each ministry's budget. Feed the AI the ministry's proposed budget, its prior-year appropriations, and its accomplishment reports. Ask for a comparative analysis highlighting significant changes and questions for the committee to raise during hearings. Section 6.4 below gives you the full template.

Use AI to **analyze proposed amendments**. When a Member of Parliament proposes shifting PHP 50 million from one P/A/P to another, feed the amendment text and the original appropriation to the AI. Ask it to identify what programs would be affected, whether the amendment complies with BAA 84's prohibition against increasing total appropriations,[^11] and what downstream effects the shift would have.

Use AI to **draft committee reports**. After hearings conclude, the committee must submit a formal report. The AI can organize hearing notes, witness testimonies, and member concerns into a structured committee report with findings and recommendations.

6.1.3 Budget Execution

Once the GAAB takes effect, it serves as the **allotment order** (GAABAO) authorizing M/O/As to obligate Personnel Services and MOOE.[^12] Items requiring additional documentation are released through **Special Allotment Release Orders (SAROs)**. M/O/As must submit **Budget Execution Documents (BEDs)** before funds are released.[^13]

What happens in this phase:

- The GAABAO authorizes M/O/As to begin obligating funds
- M/O/As submit Financial Plans, Physical Plans, Monthly Disbursement Programs, and Annual Procurement Plans
- The MFBM issues Notices of Cash Allocation for disbursement
- M/O/As implement their programs, incur obligations, and make payments
- Quarterly allotment periods guide the release schedule (January, April, July, October)[^14]

Where AI enters:

Use AI to **track obligation and disbursement rates**. Feed the AI your monthly or quarterly financial data alongside your targets. Ask it to calculate absorption rates, identify under-spending patterns, and flag P/A/Ps at risk of reverting unobligated allotments at year-end.

Use AI to **draft allotment modification requests**. BAA 84 allows modifications within an activity or project (approved by the Minister or Head of Office) and between allotment classes or operating units (approved by MFBM).[^15] The AI can draft the justification memo explaining why the modification is needed and demonstrating compliance with the rules.

Use AI to **prepare the Budget Execution Documents**. The four required BEDs — Financial Plan, Physical Plan, Monthly Disbursement Program, and Annual Procurement Plan — follow standardized formats. Give the AI your P/A/P data and ask it to populate each template. Verify the figures before submission.

6.1.4 Budget Accountability

Accountability runs throughout the year but culminates in year-end reporting. M/O/As must submit **Budget and Financial Accountability Reports (BFARs)** showing the status of appropriations, allotments, obligations, disbursements, and unexpended balances.[^16] The COA conducts external audits. Parliament reviews performance through its committees.[^17]

What happens in this phase:

- M/O/As prepare and submit periodic BFARs to the MFBM
- The MFBM consolidates financial reports for the Chief Minister, Parliament, and COA

- The COA audits financial accounts of all M/O/As and BGOCCs
- M/O/As submit annual accomplishment reports to Parliament covering work and financial results
- Parliament holds M/O/As accountable for financial and non-financial performance

Where AI enters:

Use AI to **analyze BFARs for anomalies**. Feed the AI a ministry's quarterly BFAR data. Ask it to identify items where obligations significantly exceed or fall short of allotments, flag unusual disbursement patterns, and compare current-period performance against the same period in prior years.

Use AI to **summarize COA audit findings**. COA reports are dense and technical. The AI can extract the key findings, classify them by severity (material vs. immaterial, recurring vs. first-time), and draft management responses that address each finding point by point.

Use AI to **prepare annual accomplishment reports**. Feed the AI your ministry's physical and financial targets alongside actual accomplishments. Ask it to calculate performance rates, explain variances, and present the data in the format Parliament prescribes.

6.2 AI-Assisted Budget Proposal Development

A budget proposal under BAA 84 requires more than a table of numbers. Section 19 mandates that proposals include **organizational outcomes, performance indicators, linkage to the BDP and BDIP, estimated expenditures with comparative data, descriptions of priority programs, staffing patterns, and any other information the MFBM requires**.[^18]

Most budget analysts spend the bulk of their preparation time on two tasks: compiling comparative figures and writing narrative justifications. AI accelerates both.

Building the Comparative Table

Start by organizing your data into three columns: **prior-year actual, current-year enacted, and proposed**. Break each column into the three standard allotment classes: Personnel Services (PS), Maintenance and Other Operating Expenses (MOOE), and Capital Outlays (CO).

> **Sample Prompt — Year-Over-Year Budget Comparison:**
>
> ``` I am preparing a budget proposal for [Ministry Name] for FY [Year].
>
> Here are the figures:
>
> FY 2025 Actual: - PS: [amount] - MOOE: [amount] - CO: [amount] - Total: [amount]
>
> FY 2026 Enacted (BAA 85): - PS: [amount] - MOOE: [amount] - CO: [amount] - Total: [amount]
>
> FY 2027 Proposed: - PS: [amount] - MOOE: [amount] - CO: [amount] - Total: [amount]
>
> Create a comparison table with: 1. Absolute amounts for all three years 2. Year-over-year change (amount and percentage) 3. PS as a percentage of total for each year 4. A flag for any line item that changed by more than 15% 5. A brief narrative explaining each significant change
>
> Use Philippine peso formatting. Do not round below thousands. ```

Writing the BDP Linkage Narrative

BAA 84 requires all budget proposals to **explicitly state their linkage to the approved BDP and BDIP**.[^19] This means every P/A/P must trace back to a BDP goal, strategy, or program. The AI can draft this linkage if you provide both the P/A/P descriptions and the relevant BDP chapter.

Feed the AI your proposed P/A/Ps and the BDP 2023-2028 goal that your ministry serves. Ask it to map each P/A/P to a specific BDP strategy and output. Review the mapping carefully — the AI may link a program to a plausible but incorrect BDP strategy. Your professional knowledge of your ministry's mandate is the verification layer.

Checking the 45% PS Ceiling

The BOL imposes a hard ceiling: **total appropriations for Personal Services shall not exceed 45% of the total revenue sources of the Bangsamoro Government**.[^20] This is a constitutional-level constraint. Feed the AI your ministry's PS figure and the total budget. Ask it to calculate the ratio and compare it against this ceiling. For the FY 2026 budget, the BTA Parliament's total PS across all M/O/As must stay within this limit as applied to the consolidated Bangsamoro revenue.

6.3 Budget Analysis and Comparison

Budget analysis is one of the most AI-ready tasks in government. The work is pattern-based: compare numbers, calculate changes, identify trends, and present findings. AI excels at all four.

Year-Over-Year Analysis

The most common budget analysis compares the current year against prior years. For FY 2026, BAA 85 appropriated **PHP 114,077,644,141.90** across all M/O/As.[^21] A committee analyst examining this budget needs to know: How does this compare to FY 2025? Which ministries received the largest increases? Which programs were cut? Where did priorities shift?

Feed the AI both years' appropriation tables. Ask it to produce:

1. **A ranked list of M/O/As by budget increase** (both absolute and percentage)
2. **A ranked list of M/O/As by budget decrease**
3. **PS/MOOE/CO distribution** for each M/O/A across both years
4. **Special Purpose Fund changes** — particularly the Contingent Fund, SDF, and Quick Response Fund

> **Sample Prompt — GAA Comparative Analysis:**
>
> ``` You are a budget analyst for the Bangsamoro Parliament's Committee on Finance, Budget and Management.
>
> I will provide you with two datasets: 1. BAA [Prior Year Number] - GAA for FY [Prior Year] 2. BAA 85 - GAA for FY 2026
>
> Produce a comparative analysis that includes:
>
> A. Total budget comparison (prior year vs. current year, absolute and percentage change) B. Top 10 M/O/As by budget increase (amount and percentage) C. Top 10 M/O/As by budget decrease (amount and percentage) D. PS/MOOE/CO breakdown for each M/O/A, both years, with the PS share highlighted if it exceeds 60% of the M/O/A's total E. Special Purpose Funds comparison (Contingent Fund, SDF, QRF, IMPACT, and others) F. Key observations and questions for committee hearings
>
> Present findings in tables with Philippine peso formatting. Flag any ministry where PS growth exceeds overall budget growth by more than 10 percentage points. ```

PS/MOOE/CO Breakdown Analysis

The three-way split between Personnel Services, Maintenance and Other Operating Expenses, and Capital Outlays reveals a ministry's spending priorities. A ministry with 80% PS and 5% CO is spending almost everything on salaries and almost nothing on infrastructure or equipment. This is not always wrong — a regulatory office may legitimately be staff-intensive — but it deserves scrutiny.

Ask the AI to calculate the **PS/MOOE/CO ratio** for every M/O/A and rank them. Look for:

- **Ministries where PS exceeds 70%** of total appropriation — these may need scrutiny for staffing efficiency
- **Ministries where CO dropped to zero or near-zero** — this signals possible capital investment gaps
- **Ministries where MOOE grew sharply** — check whether this reflects new programs or routine cost escalation

Cross-Ministry Comparison

Use AI to compare ministries serving similar populations or mandates. How does MBHTE's budget per student compare to MOH's budget per health facility? These cross-ministry comparisons help Parliament assess whether resource allocation matches stated priorities.

> **Sample Prompt — Cross-Ministry Budget Comparison:**
>
> ``` You are a budget analyst for the Bangsamoro Parliament.
>
> I will provide the FY 2026 appropriations for: 1. Ministry of Health (MOH) 2. Ministry of Social Services and Development (MSSD) 3. Ministry of Basic, Higher and Technical Education (MBHTE)
>
> These three ministries serve the "highest budgetary priority" areas under BAA 84, Section 17 (education, health, social services).
>
> Produce a comparison that includes: A. Total appropriation for each ministry B. Combined share of total GAAB (are education, health, and social services actually receiving the highest priority?) C. Per-capita spending estimate (use BARMM population of approximately 4.4 million) D. PS/MOOE/CO ratio for each ministry E. Year-over-year growth rate for each ministry vs. the overall budget growth rate F. Key observation: Does the budget allocation pattern reflect the "highest budgetary priority" mandate?
>
> Present findings in a single comparison table plus 5 bullet-point observations. Philippine peso formatting. ```

Special Purpose Fund Analysis

The GAAB contains several **Special Purpose Funds** that fall outside individual ministry budgets. Under BAA 84, these include the Contingent Fund, the Special Development Fund, Statutory Shares of Constituent LGUs, the Local Government Support Fund, and others approved by Parliament.[^31] The FY 2026 GAAB also includes the Personnel Gratuity Fund, Miscellaneous Personnel Benefits Fund, Quick Response Fund, IMPACT (Infrastructure Modernization and Public Asset Construction and Transformation), and the Sustainable Assistance Mechanism for Local Moral Governance.[^32]

Use AI to track SPF allocations across fiscal years. Ask it to calculate each SPF as a percentage of the total GAAB and flag any fund that grew or shrank disproportionately. Pay special attention to the **Contingent Fund**, which BAA 84 caps at 10% of total GAAB.[^33] Verify that the enacted GAAB respects this ceiling.

6.4 Preparing Budget Briefers with AI

A **budget briefer** is the primary decision-support document during budget authorization. Committee chairs, Members of Parliament, and senior staff rely on it to understand a ministry's budget request, challenge questionable items, and propose amendments.

The structure below follows the CSW format adapted for budget work. See the *Bill Drafting Manual for the Bangsamoro Parliament*, Chapter 9, for the full legislative process context that budget briefers support.[^22]

Budget Briefer Structure

Section	Content	AI Role
I. Overview	Ministry mandate, organizational structure, key functions	Draft from ministry charter and enabling law
II. Budget Summary	Total appropriation by PS/MOOE/CO with year-over-year comparison	Calculate and format from raw data
III. Major Programs	Description and cost of top P/A/Ps with BDP linkage	Draft descriptions, verify BDP alignment
IV. Personnel Profile	Filled vs. unfilled positions, PS growth trends, average salary levels	Analyze plantilla data, calculate ratios
V. Performance Assessment	Prior-year targets vs. accomplishments, obligation rates, disbursement rates	Calculate performance rates from BFARs
VI. Key Issues	Under-spending, audit findings, delayed projects, unfunded mandates	Synthesize COA reports and BFAR data
VII. Questions for Hearings	Specific questions for the committee to raise with ministry officials	Generate from analysis of Sections II-VI
VIII. Recommended Actions		Draft options with supporting rationale

Section	Content	AI Role
	Suggested committee position — approve, reduce, or amend	

Sample Prompt — Full Budget Briefer:

```` You are a senior legislative analyst preparing a budget briefer for the Committee on Finance, Budget and Management of the Bangsamoro Parliament.

Ministry: [Name] Fiscal Year: [Year]

I am providing: 1. The ministry's proposed budget for FY [Year] (by P/A/P and allotment class) 2. The enacted budget for FY [Prior Year] (same breakdown) 3. The ministry's most recent BFAR (showing obligations and disbursements against the current-year budget) 4. Key COA audit findings from the most recent audit report

Draft a budget briefer with eight sections: I. Overview — ministry mandate and key functions (2 paragraphs) II. Budget Summary — table showing PS/MOOE/CO for both years, with absolute and percentage changes III. Major Programs — top 5 P/A/Ps by appropriation size, with BDP linkage and year-over-year comparison IV. Personnel Profile — filled vs. unfilled positions, PS share of total budget, PS growth rate vs. total budget growth rate V. Performance Assessment — obligation rate, disbursement rate, key physical targets vs. accomplishments VI. Key Issues — list the top 5 budget concerns based on the data VII. Questions for Hearings — draft 10 specific questions the committee chair should ask the minister VIII. Recommended Actions — 3 options (approve as proposed, approve with specific reductions, approve with conditions)

Use formal but clear language. Philippine peso formatting. Mark any figure you cannot verify as [UNVERIFIED]. ```

## Verifying the Briefer

After the AI generates the briefer, apply these checks:

1. **Verify every number** against the source documents. The AI may transpose digits, misread allotment classes, or calculate percentages incorrectly.
2. **Check the PS ceiling** — confirm the ministry's PS does not push the consolidated BARMM PS above 45% of total revenue sources.
3. **Verify BDP linkages** — confirm the AI mapped programs to the correct BDP goals. Cross-check against the BDP 2023-2028 text.
4. **Review hearing questions** — remove questions that are politically sensitive, already answered in the budget documents, or based on AI assumptions rather than data.
````

5. **Test the recommendations** — each recommended action should follow logically from the analysis. If the briefer identifies chronic under-spending but recommends approval without conditions, the logic is broken.

6.5 Revenue Analysis and Fiscal Forecasting

The Bangsamoro Government draws revenue from multiple sources defined in the Bangsamoro Organic Law. Understanding these sources — their legal basis, relative size, and growth trajectory — is essential for any analyst working on budget policy, fiscal strategy, or development planning.

Revenue Sources Under the BOL

Article XII of the Bangsamoro Organic Law enumerates twelve categories of revenue sources.[^23] The table below organizes them with their legal basis and relevance to AI-assisted analysis:

Revenue Source	BOL Provision	Description	AI Analysis Potential
Taxes	Art. XII, Sec. 6(a)	Regional taxes levied by Parliament	Trend analysis of collection rates
Fees and Charges	Art. XII, Sec. 6(b)	Regulatory and service fees	Revenue forecasting from historical data
Annual Block Grant	Art. XII, Secs. 6(c), 15-18	5% of net national internal revenue (BIR + BOC)	Projection based on national revenue trends
Natural Resource Revenues	Art. XII, Sec. 6(d)	Shares from exploration, development, utilization	Commodity price correlation analysis
75% Tax Share	Art. XII, Secs. 6(e), 10-13	National taxes collected within BARMM	Collection efficiency analysis
GOCC Dividends	Art. XII, Sec. 6(f)	Dividends from government-owned corporations	Portfolio performance tracking
Economic Convention Grants	Art. XII, Sec. 6(g)	Revenues from economic agreements	Agreement term analysis

Revenue Source	BOL Provision	Description	AI Analysis Potential
Grants and Foreign Assistance	Art. XII, Sec. 6(h)	ODA, donations, endowments	Grant pipeline tracking
Loans and ODA	Art. XII, Sec. 6(i)	Official development assistance	Debt service ratio monitoring
Public Utility Revenues	Art. XII, Sec. 6(j)	Shares from utilities in BARMM	Utility performance benchmarking
National Government Allocations	Art. XII, Sec. 6(k)	Appropriations beyond the block grant	Historical allocation tracking
Quarry Resource Tax	Art. XII, Sec. 6(l)	Up to 10% of fair market value per cubic meter	Volume and pricing analysis

In addition to these recurring sources, the **Special Development Fund** provides PHP 5 billion per year for ten years (PHP 50 billion total) for rebuilding, rehabilitation, and development of conflict-affected communities.[^24] The SDF is established under Article XIV, Section 2 of the BOL — not Article XII.

The Block Grant: The Dominant Revenue Source

The **annual block grant** is the single largest revenue source for the Bangsamoro Government. It equals 5% of the net national internal revenue tax collection of the Bureau of Internal Revenue and the net collection of the Bureau of Customs, calculated from the third fiscal year preceding the current budget year.[^25]

For AI-assisted fiscal forecasting, this formula matters. The block grant for any given year depends on national revenue performance three years prior. Feed the AI the BIR and BOC collection data from the relevant base years. Ask it to:

1. **Calculate the expected block grant** using the BOL formula
2. **Project future block grants** based on historical national revenue growth rates
3. **Assess risk scenarios** — what happens to the Bangsamoro budget if national revenue collections decline by 5%, 10%, or 15%?
4. **Track the gap** between the block grant formula amount and actual appropriations in the national GAA

> **Sample Prompt — Block Grant Projection:**
>
> ``` You are a fiscal analyst for the Bangsamoro Planning and Development Authority.
>
> The BOL (RA 11054, Art. XII, Sec. 16) provides that the annual block grant equals 5% of the net national internal revenue tax collection of the BIR plus the net collection of the BOC from the third fiscal year preceding the current budget year.
>
> Here are the national revenue figures: [Paste BIR and BOC net collection data for relevant years]
>
> Calculate: 1. The formula-based block grant for FY [Year] 2. Block grant projections for the next 3 fiscal years using ☑% annual revenue growth 3. Three scenarios: base case (☑% growth), optimistic ([X+2]% growth), pessimistic ([X-3]% growth) 4. The PS ceiling (45% of total revenue sources) under each scenario
>
> Present results in a table with Philippine peso formatting. Show your calculations. Note any assumptions. ```

Revenue Diversification Analysis

The BOL grants the Bangsamoro Government the **power to create its own sources of revenue** and levy taxes, fees, and charges.[^26] But the Revenue Code — one of the seven priority codes mandated by the BOL — remains unenacted.[^27] This means the BARMM currently relies heavily on the block grant and national transfers rather than own-source revenue.

Use AI to analyze the **revenue mix** over time. Feed the AI multi-year revenue data (if available from BFARs or the BESF). Ask it to calculate:

- **Block grant dependency ratio** — block grant as a percentage of total revenue
- **Own-source revenue growth rate** — are regional taxes and fees growing faster or slower than the block grant?
- **Comparison with other autonomous or subnational governments** — how does BARMM's revenue mix compare to ARMM's historical revenue mix or to other subnational entities in the Philippines?

This analysis supports the BBCC's fiscal policy work and informs Parliament's deliberations on revenue legislation.

Fiscal Risk Scenario Modeling

BAA 84 allows the Bangsamoro Government to **deviate from medium-term fiscal objectives** in cases of major natural disaster, severe economic shock, or other significant unforeseeable events.[^30] The BBCC must disclose deviations and corrective measures in the Annual Fiscal Report.

AI can help you prepare for these scenarios before they happen. Feed the AI your current fiscal position — total revenue by source, total expenditure by allotment class, outstanding obligations, and cash reserves. Then ask it to model:

- **Revenue shortfall scenario:** What happens if the block grant is delayed by one quarter? Which M/O/As would need to reduce spending first?
- **Emergency expenditure scenario:** A major natural disaster requires PHP 2 billion in immediate response. Where do funds come from? How much can the Contingent Fund and Quick Response Fund cover?
- **Personnel cost escalation scenario:** If a new compensation law increases PS by 15%, how does this affect the 45% PS ceiling? What MOOE and CO programs would need to be cut?

These scenarios do not predict the future. They prepare your office to respond faster when fiscal disruptions occur. The AI drafts the scenario analysis; your team validates the assumptions and presents the options to the BBCC.

Sample Prompt — Fiscal Risk Scenario:

```` You are a fiscal risk analyst for the MFBM.

Current fiscal position: - Total GAAB: PHP [amount] - Block grant component: PHP [amount] (☑% of total) - Own-source revenue: PHP [amount] (☑% of total) - Contingent Fund: PHP [amount] - Quick Response Fund: PHP [amount]

Model three scenarios:

Scenario 1 — Block Grant Delay: The national government delays Q3 block grant release by 60 days. Identify which M/O/As face immediate cash flow problems based on their Monthly Disbursement Programs. Propose a cash rationing plan.

Scenario 2 — Major Disaster: An earthquake requires PHP 2 billion in emergency response. Calculate how much the Contingent Fund and QRF can cover. Identify which P/A/Ps could be suspended to declare savings under BAA 84, Sec. 46.

Scenario 3 — PS Ceiling Breach: A 15% PS increase is legislated. Calculate the new PS total. Determine if it breaches the 45% ceiling under BOL Art. XII, Sec. 20(a). Propose adjustments.

Present each scenario with: trigger, immediate impact, available fiscal tools, recommended actions, and legal basis under BAA 84. ```` 
````

6.6 Audit Preparation and COA Compliance

The Commission on Audit is the **exclusive external auditor** of the Bangsamoro Government.[^28] Every M/O/A and BGOCC must have its financial accounts audited by the COA. The audit findings carry legal weight — they can trigger disallowances, suspensions, and charges against responsible officials.

Understanding COA Audit Reports

COA audit reports follow a standard structure: management letter, audit observations, recommendations, and the status of prior-year findings. Each observation is classified by severity and nature (financial, compliance, or performance). The most common findings in government agencies involve:

- **Unliquidated obligations** — obligations incurred but not settled within the prescribed period
- **Cash advances** not liquidated within the reglementary period
- **Procurement irregularities** — failure to follow RA 12009 (New Government Procurement Act) procedures
- **Unreconciled accounts** — differences between agency records and COA records
- **Non-submission of reports** — failure to submit BFARs or other required reports on time

Using AI for COA Audit Preparation

Before the audit, use AI to conduct a **pre-audit self-assessment**. Feed the AI your financial records, obligation registers, and disbursement journals. Ask it to identify potential audit findings before the COA examiner arrives.

> **Sample Prompt — Pre-Audit Self-Assessment:**
>
> ``` You are an internal auditor for [M/O/A Name] in the Bangsamoro Government.
>
> I am providing the following data for FY [Year]: 1. Summary of obligations incurred by quarter 2. Summary of disbursements by quarter 3. List of cash advances and their liquidation status 4. List of procurement transactions over PHP 1 million 5. Prior-year COA audit findings and our management responses
>
> Conduct a pre-audit assessment: A. Identify obligations that remain unliquidated beyond the Extended Payment Period B. Flag cash advances not liquidated within the reglementary period C. Check if prior-year audit findings have been fully addressed (compare our management responses against actual actions taken) D. Identify potential compliance issues based on the data patterns E. Draft a management action plan addressing each identified risk
>
> Use BAA 84 provisions on budget execution (Secs. 34-51) and accountability (Secs. 60-67) as the compliance framework. Flag any item requiring immediate attention as [URGENT]. ```

Responding to COA Findings

After receiving COA audit observations, M/O/As must submit **management comments** addressing each finding. AI can draft these responses, but you must verify every factual claim. A management response that misrepresents the status of corrective actions creates more problems than the original finding.

Feed the AI the specific COA observation and your supporting documents (e.g., evidence that the finding has been corrected, timeline for pending corrections, or justification for why the finding is not applicable). Ask it to draft a response that:

1. **Acknowledges** the finding (never argue with a COA observation unless you have clear legal basis)
2. **Explains** the root cause
3. **Details** corrective actions already taken
4. **Commits** to a timeline for completing remaining actions
5. **Provides** supporting documentation references

BAA 84 Enforcement Provisions

Budget staff should know the enforcement provisions because they define the consequences of non-compliance. BAA 84 establishes five categories of liability:[^29]

Violation	BAA 84 Section	Consequence
Illegal certification of fund availability	Sec. 71	Grave offense; joint and several liability for full amount
Illegal expenditures	Sec. 72	Null and void; grave offense; joint and several liability
Incurrence of overdraft	Sec. 73	Less grave offense; personal liability
Fraudulent accountability reports	Sec. 74	Administrative and criminal sanctions
Failure to submit reports or comply with transparency	Sec. 75	Automatic salary suspension; withholding of allotments

AI cannot protect you from these consequences. But it can help you **identify compliance risks before they become audit findings**. Build a compliance checklist based on these provisions and run it against your financial data quarterly.

Case Study: AI-Assisted Analysis of BAA 85 (FY 2026 GAA)

The task: A committee analyst is assigned to prepare a comparative budget briefer for the Committee on Finance, Budget and Management before plenary deliberation of the FY 2026 budget.

The approach:

1. **Context preparation** (30 minutes): The analyst gathers the full text of BAA 85, the prior-year GAA, each ministry's accomplishment report, and the most recent BFARs. She uploads these to her AI tool.
2. **First prompt** (5 minutes): She asks the AI to produce a ministry-by-ministry comparison table showing FY 2025 vs. FY 2026 appropriations by PS/MOOE/CO, with percentage changes and flags for items exceeding 20% change.
3. **AI output** (3 minutes): The AI generates a 15-page comparative table. The total FY 2026 appropriation is PHP 114,077,644,141.90. The BTA Parliament receives PHP 7,257,475,847.00. The Ministry of Health receives the largest operational budget among line ministries. Capital Outlays for the Ministry of Public Works dominate the CO category.
4. **Verification** (2 hours): The analyst checks every figure against the source documents. She catches two transposition errors in the MOOE figures for MILG. She corrects the AI's classification of the Special Development Fund — the AI had placed it under the OCM budget rather than as a Special Purpose Fund.
5. **Second prompt** (5 minutes): She asks the AI to generate 10 hearing questions for each of the top 5 ministries by budget size, focusing on under-spending patterns, unfilled positions, and unresolved COA findings.
6. **Third prompt** (5 minutes): She asks the AI to draft the "Key Issues" section, highlighting ministries with obligation rates below 70% in the prior year and programs with no capital outlay allocation despite infrastructure mandates.
7. **Final output** (1 hour to finalize): The analyst reviews, corrects, and finalizes a 25-page budget briefer. Total time: approximately 4 hours. Without AI, this analysis would have taken 3-4 working days.

Lessons:

- **AI saved 70% of the drafting time** but required 2 hours of verification
- **The AI made two factual errors** — both caught during verification
- **The hearing questions were the highest-value output** — the AI generated questions the analyst had not considered, based on patterns in the data
- **The analyst's domain knowledge was indispensable** for correcting the SDF classification error — the AI did not know the GAAB's internal structure well enough to distinguish SPFs from ministry budgets

Chapter Summary

The Bangsamoro budget cycle generates an enormous volume of documents at every phase — from budget proposals in April to COA audit responses the following year. AI does not change the cycle. It accelerates the document work that drives each phase.

Here is what you can do immediately:

- **During preparation:** Use AI to draft budget proposals that comply with BAA 84, Section 19 requirements and link every P/A/P to the BDP
- **During authorization:** Use AI to prepare eight-section budget briefers that give committee chairs the analysis they need for hearings
- **During execution:** Use AI to track obligation rates, flag under-spending, and draft allotment modification justifications
- **During accountability:** Use AI to conduct pre-audit self-assessments and draft management responses to COA findings
- **For revenue analysis:** Use AI to project block grant levels, analyze revenue diversification, and model fiscal scenarios

Every output requires human verification. The Rule of Signature from Chapter 3 applies here with full force: if your name goes on the budget briefer, you verify every number.

The next chapter takes you into the legislative process — where the budget becomes law and where AI assists in drafting, analyzing, and tracking the bills that shape Bangsamoro governance.

Footnotes

[^1]: BAA 85, Sec. 1. The total appropriation for FY 2026 is PHP 114,077,644,141.90, drawn from the annual block grant, other subsidies, national tax shares, regional collections, and prior-year appropriations.

[^2]: Bangsamoro Autonomy Act No. 84, "An Act Prescribing a Budget System for the Bangsamoro Government" (Bangsamoro Budget System Act of 2025), enacted December 9, 2025. BAA 84 governs the preparation, authorization, execution, and accountability of the Bangsamoro budget.

[^3]: BAA 84, Sec. 16 (Planning-Investment-Programming-Budgeting Continuum). Budget priorities shall be based on regional development strategies in the approved BDP.

[^4]: BAA 84, Sec. 17 (Budget Priorities Framework). The BBCC shall present the framework to the Chief Minister and Cabinet in April of each year.

[^5]: BAA 84, Sec. 18 (Annual Budget Preparation Process). The MFBM, through the Bangsamoro Budget Office, prescribes the budget preparation process and calendar in the annual Budget Call.

[^6]: BAA 84, Sec. 21 (Budget Evaluation). The six evaluation criteria are: (a) relationship with the Chief Minister's priority agenda; (b) past performance vis-a-vis target spending; (c) implementation readiness; (d) program convergence; (e) all sources and authorized uses of funds; and (f) other criteria as determined by the MFBM.

[^7]: BAA 84, Sec. 23 (The Proposed Bangsamoro Budget). The Chief Minister shall submit the Proposed Bangsamoro Budget to Parliament as far as practicable not later than the 30th of September of each year.

[^8]: BAA 84, Sec. 16, par. 2: "All budget proposals for P/A/Ps shall explicitly state their linkage to the approved BDP and BDIP."

[^9]: BAA 84, Sec. 17, par. 2. The highest budgetary priority shall be given to education, health, and social services. At least 5% of each M/O/A and BGOCC's total appropriation shall be set aside for gender-responsive programs following a gender and development plan.

[^10]: BAA 84, Sec. 26 (Schedule of Budget Consideration). The GABB shall be filed and calendared for first reading within 5 calendar days from budget submission. The committee report is due within 60 calendar days from referral. Plenary debate and amendments must conclude within 30 calendar days from submission of the committee report.

[^11]: BAA 84, Sec. 31 (Prohibition Against the Increase of Appropriations): "The Parliament shall, in no case, increase the total budget appropriations proposed by the Chief Minister."

[^12]: BAA 84, Sec. 36 (GAABAO). Upon effectivity, the GAAB serves as the allotment order authorizing M/O/As and BGOCCs to obligate PS and MOOE, subject to certain exceptions.

[^13]: BAA 84, Sec. 38 (Budget Execution Documents). M/O/As must submit BEDs at the onset of each budget execution phase: Financial Plan, Physical Plan, Monthly Disbursement Program, and Annual Procurement Plan.

[^14]: BAA 84, Sec. 37(b). Each calendar year is divided into four quarterly allotment periods beginning on the 1st day of January, April, July, and October.

[^15]: BAA 84, Sec. 49 (Rules on Modification of Allotments). Ministers or Heads of Office may approve changes within an activity or project. The MFBM approves transfers between allotment classes, between operating units, modifications within SPFs, and Magna Carta benefit payments.

[^16]: BAA 84, Sec. 61 (Submission of BFARs). Each M/O/A shall report the status of appropriations, allotments, obligations, disbursements, unliquidated obligations, and unexpended balances.

[^17]: BAA 84, Sec. 65 (Annual Report on Accomplishments to the Parliament). M/O/As and BGOCCs shall submit annual reports covering work and financial results. Parliament monitors efficiency and effectiveness through its committees.

[^18]: BAA 84, Sec. 19 (Budget Proposal). The required contents include: organizational outcomes, performance indicators, BDP/BDIP linkage, estimated expenditures with comparative data, program descriptions, staffing patterns, and other MFBM-required information.

[^19]: BAA 84, Sec. 16, par. 2.

[^20]: Republic Act No. 11054 (BOL), Art. XII, Sec. 20(a). Total PS appropriations for one fiscal year shall not exceed 45% of total revenue sources. Salaries for public utility and economic enterprise employees are excluded from this computation.

[^21]: BAA 85, Sec. 1.

[^22]: The *Bill Drafting Manual for the Bangsamoro Parliament* (Mambayao, 2026), Chapter 9 (The Budget Process), provides the legislative process context within which budget briefers operate.

[^23]: Republic Act No. 11054 (BOL), Art. XII, Sec. 6 (Sources of Revenues). Twelve categories enumerated from (a) through (l).

[^24]: Republic Act No. 11054 (BOL), Art. XIV, Sec. 2 (Special Development Fund). PHP 50 billion at PHP 5 billion per year for 10 years from ratification.

[^25]: Republic Act No. 11054 (BOL), Art. XII, Sec. 16 (Block Grant Amount). The base year is the third fiscal year immediately preceding the current fiscal year.

[^26]: Republic Act No. 11054 (BOL), Art. XII, Sec. 6.

[^27]: Republic Act No. 11054 (BOL), Art. XII, Sec. 14 (Bangsamoro Tax and Revenue Code). The Parliament is mandated to enact this code. As of the current transition period, it remains pending.

[^28]: BAA 84, Sec. 67 (Exclusive External Auditor): "The financial accounts of M/O/As and BGOCCs shall continue to be audited by the COA, which shall serve as the exclusive external auditor of the Bangsamoro Government."

[^29]: BAA 84, Secs. 71-75 (Enforcement provisions under Title VII).

[^30]: BAA 84, Sec. 11 (Deviations from Fiscal Objectives).

[^31]: BAA 84, Sec. 28 (Special Purpose Funds).

[^32]: BAA 85, Table of Contents (Special Purpose Funds section): Personnel Gratuity Funds, Miscellaneous Personnel Benefits Fund, Contingent Fund, Special Development Fund, Sustainable Assistance Mechanism for Local Moral Governance, Bangsamoro Support Fund to Judiciary, Quick Response Fund, and IMPACT.

[^33]: BAA 84, Sec. 29, par. 3: "In no case shall the Contingent Fund exceed ten percent (10%) of the total GAAB."

07

AI for Legislative and Policy Work

The Bangsamoro Parliament has enacted 89 Bangsamoro Autonomy Acts since 2019.[^1] These 89 laws span 13 domains — governance, budget, health, education, labor, local government, electoral, environment, social welfare, symbols, peace and security, and more.[^2] Behind every enacted BAA sits a chain of documents: explanatory notes, committee reports, legislative briefers, comparative matrices, interpellation questions, floor amendment proposals, and policy research papers. Each document requires research, cross-referencing, and drafting under tight parliamentary timelines.

This is the legislative reality AI was built to accelerate. AI does not vote on bills. It does not exercise political judgment. But it can scan 89 enacted BAAs for conflicts in under a minute. It can draft an explanatory note from a policy brief overnight. It can prepare interpellation questions that anticipate the sponsor's likely responses. The staff analyst who once spent three days preparing a legislative briefer can now produce a stronger first draft in three hours — and spend the remaining time on the analysis that requires human judgment.

This chapter maps AI onto the entire legislative process, from initial research through enactment. It gives you specific prompts, real BARMM examples, and cross-references to the *Bill Drafting Guidebook for the Bangsamoro Parliament* where deeper procedural guidance exists.[^3]

7.1 AI in the Legislative Process — From Research to Enactment

The Bangsamoro Parliament follows a defined process for enacting legislation. The *Bill Drafting Guidebook* documents this in full across Chapters 2 and 7.[^4] Here, the focus is on **where AI enters** at each stage and **what it can do** at that point.

Table 7.1: Legislative Process Stages with AI Entry Points

Stage	What Happens	Key Documents	AI Can	AI Cannot
1. Legislative Directive	MP identifies a policy need; staff receives instructions	Initial Legislative Template	Scan BDP 2023-2028 for alignment; check if existing BAAs	Decide what legislation to pursue

Stage	What Happens	Key Documents	AI Can	AI Cannot
			already cover the topic	
2. Legislative Research	Staff researches the policy landscape, existing laws, comparative models	Legislative Research Briefer, Policy Landscape Scan	Search and summarize existing BAAs, national laws, and comparative legislation; identify gaps and conflicts	Assess political feasibility or stakeholder sentiment
3. First Draft	Drafter prepares the bill text, explanatory note, and comparative matrix	Working Outline, Draft Bill, Comparative Matrix	Generate first drafts of provisions, definitions, and explanatory notes from policy research	Guarantee BOL compliance without human legal review
4. Consultation	Experts, agencies, and constituents provide feedback	Consultation summaries, expert position papers	Synthesize consultation inputs; identify recurring themes and objections	Replace face-to-face stakeholder engagement
5. Review and Revision	Staff revises draft based on consultation findings	Revised Draft, Gap Analysis	Compare drafts to flag what changed; check internal consistency	Make political trade-off decisions
6. Finalization and Filing	MP approves; co-authors sign; bill filed with Bills and Index Division	Final Draft Bill	Format the bill per parliamentary conventions; generate co-authorship memo	Authorize filing or represent MP intent
7. Committee Stage	Committee examines the bill, holds hearings,	Committee Report, Hearing Minutes	Prepare committee briefers; draft proposed amendments	Conduct committee hearings

Stage	What Happens	Key Documents	AI Can	AI Cannot
	proposes amendments		with justifications	
8. Interpellation	MPs question the bill's sponsor on the floor	Interpellation questions, anticipated answers, manifestations	Generate question trees; anticipate sponsor responses; draft manifestations	Exercise parliamentary privilege
9. Floor Amendments and Voting	Plenary debates, amends, and votes	Floor amendments, voting manifestations	Draft amendment language; prepare vote manifestation talking points	Cast votes
10. Enrollment and Executive Action	Enrolled bill transmitted to Chief Minister	Enrolled copy	Verify enrolled text against approved version	Authenticate the enrolled bill

Use this table as your master reference. Every section in this chapter corresponds to one or more of these stages. When you receive a legislative assignment, locate the stage first, then go to the relevant section.

7.2 Legislative Research with AI

Legislative research is the foundation. A bill built on weak research will collapse during interpellation. AI transforms this phase by compressing weeks of manual searching into hours of structured analysis. But the human researcher still directs the inquiry, validates the sources, and exercises judgment about relevance.

The *Bill Drafting Guidebook*, Chapter 2, Section 2.3, covers legislative research in procedural detail.[^5] This section focuses on the AI techniques that make that research faster and deeper.

7.2.1 Policy Landscape Scanning

Before drafting a single provision, you need the **policy landscape** — a map of every law, regulation, policy, plan, and ongoing initiative that touches your bill's subject matter.

The manual approach: Open each of the 89 BAAs, read the title and scope provisions, check for relevance, note overlaps, and compile a list. Then do the same for relevant national laws, executive orders, and IRRs. This takes days.

The AI approach: Load the full list of enacted BAAs (with short titles and categories) into your AI context. Ask it to identify every BAA that intersects with your topic. Then expand to national laws using web search or uploaded reference documents.

> **Sample Prompt — Policy Landscape Scan:**
>
> ``` You are a legislative researcher for the Bangsamoro Parliament.
>
> I am preparing a bill on [TOPIC]. Scan the following list of 89 enacted Bangsamoro Autonomy Acts and identify every BAA that: 1. Directly addresses this topic 2. Contains provisions that may overlap or conflict 3. Establishes agencies, commissions, or offices with related mandates 4. Defines terms that this bill must adopt or reconcile
>
> For each relevant BAA, provide: - BAA number and short title - Specific relevant provisions (section/article numbers if available) - Nature of the relationship (direct overlap, adjacent authority, definitional dependency, potential conflict)
>
> Also identify relevant national laws (Republic Acts) that apply within BARMM under BOL Article V's power allocation framework.
>
> [Paste the BAA quick-reference table or index here] ```

What to verify: AI may miss BAAs whose relevance is indirect. Always cross-check its list against the full categorized index. If your bill touches health, do not rely only on BAAs the AI categorized as health-related — also check social welfare, local government, and budget BAAs that may contain health provisions. For example, BAA 85 (GAA FY 2026) contains special purpose funds that may affect health program delivery.[^6]

7.2.2 Comparative Legislation Analysis

Every strong bill draws from **comparative models** — how other jurisdictions addressed the same policy problem. For BARMM, this means three tiers of comparison:

1. **National Philippine laws** on the same subject (e.g., for a Bangsamoro Labor Code, compare with the national Labor Code and subsequent amendments)
2. **ARMM Muslim Mindanao Autonomy Acts (MMAAs)** that the Bangsamoro Parliament may have repealed, amended, or superseded
3. **International frameworks** relevant to the Bangsamoro context (ASEAN standards, OIC guidelines, UN conventions the Philippines has ratified)

AI handles comparative analysis well because it involves pattern-matching across structured documents. Feed it two or three laws on the same topic. Ask it to identify differences in scope, coverage, definitions, enforcement mechanisms, and institutional arrangements.

> **Sample Prompt — Comparative Legislation Analysis:**
>
> ``` Compare the following three laws addressing [TOPIC]:
>
> 1. [National law - paste or summarize key provisions]
> 2. [BAA or MMAA - paste or summarize key provisions]
> 3. [International framework - paste or summarize key provisions]
>
> For each law, analyze: - Scope and coverage (who is covered, what activities, what territory) - Key definitions and whether they align or conflict - Enforcement mechanisms and penalties - Institutional responsibilities (which agency implements) - Gaps that the proposed Bangsamoro bill could address
>
> Present findings in a comparison matrix with rows for each criterion and columns for each law. After the matrix, list the three most significant gaps the proposed bill should fill. ```

Real BARMM example: When the BTA enacted BAA 82 (Bangsamoro Labor and Employment Code), drafters needed to reconcile provisions with the national Labor Code while exercising the Bangsamoro's enumerated power over labor under BOL Article V, Section 2.[^7] A comparative analysis using AI would map every section of the national Labor Code against BAA 82's provisions, flagging areas where the Bangsamoro law extends, modifies, or defers to national law.

7.2.3 Cross-Referencing 89 BAAs

The 89 enacted BAAs form an interconnected legal web. BAA 37 amends BAA 13. BAA 70 amends BAA 54. BAA 87 and BAA 88 both amend BAA 35.[^8] BAA 86 replaced the unconstitutional BAA 58 and BAA 77 after the Supreme Court's ruling in *Ali et al. v. BTA* and *Macapaar et al. v. COMELEC*.[^9] Miss one of these amendment chains and your bill may contradict an already-amended provision.

Why cross-referencing matters: A bill proposing to create a new government body must check BAA 13 (Administrative Code) for organizational requirements, BAA 17 (Civil Service Code) for staffing rules, BAA 11 (Power of Appointment) for how leaders are appointed, and the current GAA for funding implications. Skip any one and the committee will catch it during hearings.

The AI approach: Load the BAA index or quick-reference table into your AI context. Then give it your draft bill's key provisions and ask it to trace every connection.

> **Sample Prompt — BAA Cross-Reference Check:**
>
> ``` I am drafting a bill that creates a [NEW BODY/PROGRAM/REGULATION] in BARMM.
>
> Cross-reference this draft against the following enacted BAAs and identify potential conflicts, dependencies, or required references:
>
> Key provisions of my draft: [Paste your draft bill or its working outline]
>
> Check specifically: 1. Does any existing BAA already establish a body with overlapping mandate? (Check BAAs 4, 5, 6, 8, 10, 12, 31, 49, 59, 83) 2. Does the draft comply with organizational requirements under BAA 13 (Administrative Code)? 3. Does the draft comply with civil service requirements under BAA 17 (Civil Service Code)? 4. Does the appointment mechanism comply with BAA 11 (Power of Appointment)? 5. Does the draft use terms defined differently in any existing BAA? 6. Are there amendment chains I need to account for? (e.g., BAA 37 amends BAA 13; BAA 70 amends BAA 54)
>
> For each finding, cite the specific BAA and section. [Paste BAA quick-reference table] ```

What to verify: AI cross-referencing is only as good as the data you provide. If you feed it only BAA titles and short descriptions, it will catch obvious overlaps but miss subtle definitional conflicts buried in specific sections. For high-stakes bills, supplement the AI scan with manual review of the most relevant BAAs — especially the four priority codes (BAA 13, BAA 17, BAA 18, BAA 35) that form BARMM's core legal infrastructure.[^10]

7.3 AI-Assisted Bill Drafting

Bill drafting is the core legislative craft. The *Bill Drafting Guidebook* devotes four chapters to it: Chapter 3 (Anatomy of a Bill), Chapter 4 (Special Bill Types), Chapter 6 (Legislative Style), and Chapter 10 (Amendments).[^11] AI does not replace mastery of those chapters. It accelerates the mechanical work so the drafter can focus on substance and precision.

What AI Can Draft

AI is effective for generating **first drafts** of the following bill components:

- **Explanatory Notes** — the policy narrative that accompanies the bill, explaining its purpose, context, and expected impact
- **Declaration of Policy** sections — articulating the legislative intent in the format the Parliament expects
- **Definition of Terms** — generating initial definitions based on the bill's subject matter, then refining them against existing BAA definitions
- **Administrative Provisions** — implementing agencies, reporting requirements, IRR timelines
- **Final Provisions** — separability, repealing, and effectivity clauses that follow standardized formulas
- **Comparative Matrices** — side-by-side comparison of the draft bill against existing laws

What AI Should Not Draft Alone

These components require drafter judgment, political awareness, and legal expertise that AI cannot replicate:

- **Substantive provisions** that create rights, impose obligations, or allocate powers — AI can generate options, but the drafter must decide what the law commands
- **Penalty provisions** — criminal penalties, civil sanctions, and administrative fines require calibration against proportionality principles and existing penal frameworks
- **Appropriation provisions** — budget amounts must come from MFBM data, not AI estimates

- **Shari'ah compliance provisions** — require consultation with Islamic legal scholars per BOL Article X[^12]

The AI-Assisted Drafting Workflow

Follow this five-step workflow for AI-assisted bill drafting:

Step 1 — Feed the research. Upload or paste your policy landscape scan, comparative analysis, and cross-reference findings. The more context the AI has, the better its draft.

Step 2 — Start with the explanatory note. Draft the explanatory note first. It forces you to articulate the problem, the proposed solution, and the expected impact before writing a single provision. The *Bill Drafting Guidebook*, Chapter 3, Section 3.1.1, describes the explanatory note's purpose and structure.[^13]

> **Sample Prompt — Explanatory Note:**
>
> ``` Draft an explanatory note for a proposed Bangsamoro Autonomy Act on [TOPIC]. Use the following structure:
>
> 1. BACKGROUND AND CONTEXT — The problem this bill addresses. Include relevant statistics and conditions in BARMM.
> 2. POLICY AND LEGAL BASIS — Why the Bangsamoro Parliament has the authority to legislate on this topic. Cite BOL Article V, Section 2, and the specific enumerated power.
> 3. SALIENT FEATURES — The bill's key provisions in summary.
> 4. EXPECTED IMPACT — What the bill will achieve if enacted.
> 5. ALIGNMENT — How the bill supports the Bangsamoro Development Plan 2023-2028 and the Chief Minister's 12-Point Priority Agenda.
>
> Source material: [Paste research findings, policy brief, and BDP alignment notes]
>
> Write in direct, professional legislative prose. Avoid filler language. Every sentence must advance the argument for enactment. Mark any claim without a source as [VERIFY]. ```

Step 3 — Draft the working outline. Use the AI to convert your explanatory note into a **working outline** — the skeletal structure of the bill showing articles, sections, and subsections. The *Bill Drafting Guidebook*, Chapter 2, Section 2.4.1, describes this step.[^14]

Step 4 — Draft individual provisions. Work section by section. Give the AI the working outline, the relevant portion of your research, and clear instructions about what each section should accomplish. Review each provision against the style rules in the *Bill Drafting Guidebook*, Chapter 6 — particularly the rules on "shall," "may," and "must" (Section 6.9); active voice (Section 6.11); and sentence length (Section 6.12).[^15]

Step 5 — Run the quality review. Use the AI to perform the self-review checklist from the *Bill Drafting Guidebook*, Chapter 11.[^16] Feed it the complete draft and ask it to check for:

- BOL compliance (does every provision fall within enumerated powers?)
- Internal consistency (are terms used the same way throughout?)
- Completeness (does every duty have an accountable body? does every violation have a consequence?)
- Existing BAA conflicts (does anything contradict an enacted law?)

Case Study: AI-Assisted Cross-Referencing for BAA 86

The situation: In October 2025, the Supreme Court declared BAA 58 (Parliamentary Districts Creation) and BAA 77 (Reconstituted Parliamentary Districts) unconstitutional in *Ali et al. v. BTA* (G.R. No. E-02219) and *Macapaar et al. v. COMELEC* (G.R. No. E-02235).[^17] The BTA needed to enact fresh redistricting legislation — fast.

The cross-referencing challenge: The new bill had to account for the Sulu exclusion following *Province of Sulu v. Medialdea* (G.R. Nos. 242255, 243246, 243693; Sept. 9, 2024; finalized Nov. 26, 2024),[^18] the creation of 8 new SGA municipalities under BAAs 41-48, and the electoral machinery in BAA 35 (Electoral Code) as amended by BAAs 87 and 88.

How AI would accelerate this: An AI cross-reference scan of the full BAA index against the term "parliamentary district" would surface BAAs 35, 58, 77, 86, 87, and 88 — the complete amendment chain. Scanning for "SGA" or "Special Geographic Area" would surface BAAs 41-48 (the eight new municipalities) and confirm their constituent barangays. Scanning for "Sulu" would flag every BAA that referenced Sulu in its coverage — allowing drafters to verify that the new law correctly excluded Sulu from the district allocation.

The result: BAA 86 (Parliamentary District Act) was enacted on January 20, 2026, establishing 32 single-member parliamentary districts across the post-Sulu BARMM territory: Lanao del Sur (9 districts), Maguindanao del Norte (5), Maguindanao del Sur (5), Basilan (4), Tawi-Tawi (4), Cotabato City (3), and the SGA (2).[^19]

The lesson: Cross-referencing is not a luxury — it is a legislative necessity. AI reduces the risk of missing an amendment chain, an excluded territory, or a conflicting provision. But the drafter must still verify every AI finding against the actual enacted text.

7.4 Preparing Legislative Briefers with AI — The 13-Section CSW Format

The **Legislative Analysis Briefer** is the single most important staff document in the Bangsamoro Parliament. It is the Completed Staff Work (CSW) that equips a Member of Parliament to engage intelligently during committee hearings, interpellation, and plenary voting. The *Bill Drafting Guidebook*, Chapter 8, lays out the full 13-section format.[^20]

AI does not replace the briefer writer. It accelerates the research-intensive sections and generates structured first drafts that the writer then validates and refines.

The 13 Sections and Where AI Helps Most

Section	Content	AI Contribution	Human Judgment Required
1. Brief Description	What the bill does in 2-3 paragraphs	Draft from the bill's explanatory note and long title	Verify accuracy against actual bill text
2. Related Laws and Issuances	Every existing law that touches the bill	Full cross-reference scan (see Section 7.2.3)	Validate completeness; add IRRs and EOs
3. Policy and Legal Analysis	How the bill fits the legal hierarchy and BOL	Analyze BOL compliance, constitutional issues	Assess political dimensions the AI cannot see
4. Impact Assessment	Economic, social, institutional effects	Generate impact categories from the bill's provisions	Calibrate severity and likelihood of impacts
5. Shari'ah Considerations	Alignment with Islamic jurisprudence	Flag provisions that touch personal law, inheritance, or family matters	Consult Islamic legal scholars for authoritative rulings
6. Gender Analysis	Differential impact on men and women	Scan for gender-neutral language; identify provisions with gendered effects	Apply GAD lens to policy implications

Section	Content	AI Contribution	Human Judgment Required
7. Implementing Agencies	Who implements, with what resources	Extract from the bill's administrative provisions	Verify institutional capacity and readiness
8. Implementation Timeline	Phased rollout, IRR deadlines	Generate a timeline from the bill's transitory provisions	Assess whether the timeline is realistic
9. Budgetary Implications	Cost estimates and funding sources	Calculate from the bill's appropriation section and comparable BAAs	Verify with MFBM data and current fiscal position
10. Prior Proceedings	What happened in committee and previous readings	Summarize hearing minutes and committee reports	Confirm accuracy of procedural history
11. Interpellation Questions	Questions for the sponsor during plenary	Generate question trees (see Section 7.5)	Select the strategic questions that advance the MP's position
12. Proposed Amendments	Specific textual changes with justifications	Draft amendment language (see *Bill Drafting Guidebook*, Chapter 10)	Decide which amendments to prioritize
13. MP's Position	The Member's speech or vote manifestation	Draft talking points based on the full analysis	The MP's political judgment is final

> **Sample Prompt — Legislative Briefer (Sections 1-4):**
>
> ``` Prepare the first four sections of a Legislative Analysis Briefer for [BILL NUMBER AND TITLE]. Use the 13-section CSW format.
>
> Section 1 — Brief Description: Summarize the bill in 2-3 paragraphs. State what it does, who it covers, and what it changes in the current legal framework.
>
> Section 2 — Related Laws and Issuances: List every existing law that relates to this bill. Include: - Relevant BOL provisions (cite article and section) - Enacted BAAs (cite number and short title) - National laws (cite RA number) - Existing IRRs and executive orders For each, explain the specific relationship to this bill.
>
> Section 3 — Policy and Legal Analysis: Analyze whether the bill falls within the enumerated powers of the Bangsamoro Government under BOL Art. V, Sec. 2. Identify any provisions that may overlap with national law and require intergovernmental coordination per BOL Art. VI.
>
> Section 4 — Impact Assessment: Assess the bill's expected impact on: (a) BARMM institutions, (b) affected populations, (c) the regional budget, (d) existing programs and services.
>
> Source material: [Paste the full bill text or its key provisions] [Paste the BAA quick-reference table] [Paste relevant BOL provisions]
>
> Mark any assertion without a verified source as [VERIFY]. ```

Workflow tip: Draft the briefer in two passes. First pass: use AI for Sections 1, 2, 3, 7, and 8 (these are research-heavy and benefit most from AI's scanning speed). Second pass: draft Sections 4, 5, 6, 9, 11, and 12 with AI assistance but heavier human input. Sections 10 and 13 require institutional knowledge and the MP's direction — draft these last.

7.5 AI for Interpellation and Plenary Preparation

Interpellation is where legislative homework meets parliamentary performance. A well-prepared interpellator exposes weaknesses in a bill. A poorly prepared one wastes plenary time and loses credibility. The *Bill Drafting Guidebook*, Chapter 8, Sections 8.4.1 through 8.4.3, covers interpellation preparation in detail.[^21]

AI transforms interpellation preparation in three ways: it generates **question trees**, it **anticipates sponsor responses**, and it drafts **manifestation statements**.

Generating Question Trees

A **question tree** starts with a strategic objective (what do you want to establish during interpellation?) and branches into primary questions, follow-up questions, and contingency questions based on possible answers.

> **Sample Prompt — Interpellation Question Tree:**
>
> ``` I am preparing for interpellation of [BILL NUMBER AND TITLE].
>
> My strategic objectives are: 1. [Objective 1 — e.g., establish that the bill's implementing agency lacks capacity] 2. [Objective 2 — e.g., demonstrate that the budget allocation is insufficient] 3. [Objective 3 — e.g., show that Section X conflicts with BAA Y]
>
> For each objective, generate: - 3 primary questions (open-ended, establishing facts) - 2 follow-up questions per primary question (narrowing, building the argument) - 1 closing question per objective (designed to establish the record for your proposed amendment)
>
> For each question, anticipate the sponsor's likely response and indicate whether the response helps or hurts my objective.
>
> Format as a branching tree: Objective → Primary → Follow-up (if sponsor says X) → Follow-up (if sponsor says Y) → Closing
>
> Source material: [Paste the bill text and your legislative briefer analysis] ```

Anticipating Sponsor Responses

The sponsor and their staff will also prepare for interpellation. AI can model the sponsor's likely defense by analyzing the bill's explanatory note, the committee report, and the sponsor's public statements on the topic.

> **Sample Prompt — Sponsor Response Analysis:**
>
> ``` Based on the following bill and its explanatory note, predict how the bill's sponsor would respond to each of these interpellation questions:
>
> [Paste questions] [Paste bill text and explanatory note]
>
> For each predicted response, identify: 1. The strongest point in the sponsor's defense 2. The weakest point that a follow-up question could exploit 3. A suggested follow-up question targeting that weakness ```

Drafting Manifestations

A **manifestation** is a statement a Member of Parliament makes on the record during plenary deliberation. It may express support, opposition, a reservation, or an explanation of vote. The *Bill Drafting Guidebook*, Chapter 8, Section 8.6, covers position speeches and vote manifestations.[^22]

> **Sample Prompt — Vote Manifestation:**
>
> ``` Draft a 1-minute vote manifestation for [MP NAME] on [BILL NUMBER AND TITLE].
>
> Position: [SUPPORT / OPPOSE / SUPPORT WITH RESERVATIONS]
>
> Key points to include: 1. [Main reason for the position] 2. [Reference to a specific provision — cite section number] 3. [Reference to alignment or conflict with BDP 2023-2028 or BOL mandate]
>
> Tone: Parliamentary, direct, respectful. The manifestation will be read aloud in plenary. Keep it under 250 words. The MP speaks in [English/Filipino/Taglish]. ```

7.6 Policy Recommendation Drafting with AI — Bardach's Eightfold Path Accelerated

Not all policy work results in legislation. Some produces **policy recommendations** — structured analyses that inform executive action, ministerial decisions, or intergovernmental positions. Eugene Bardach's **Eightfold Path** is the standard methodology taught in Philippine public policy programs.[^23] AI accelerates every step.

The Eightfold Path with AI Entry Points

Step	Bardach's Step	What You Do	AI Accelerates
1	**Define the Problem**	Articulate the policy problem in one clear statement	Scan BDP 2023-2028, BAAs, and situational data to sharpen the problem definition
2	**Assemble the Evidence**	Gather data, studies, reports, and stakeholder positions	Summarize uploaded documents; extract relevant data points; organize evidence by theme
3	**Construct the Alternatives**	Develop 3-5 policy options (always including "status quo")	Generate options from comparative analysis; ensure each option is distinct and actionable
4	**Select the Criteria**	Choose evaluation criteria (cost, effectiveness, equity, political feasibility, administrative feasibility)	Propose criteria based on the policy domain; weight them per BARMM governance priorities
5	**Project the Outcomes**	Estimate what each alternative would	Model projected outcomes based on available data; flag

Step	Bardach's Step	What You Do	AI Accelerates
		produce against each criterion	assumptions as [ASSUMPTION]
6	**Confront the Trade-offs**	Compare alternatives and identify what you gain and lose with each	Generate a trade-off matrix; highlight where criteria conflict
7	**Decide**	Recommend the best alternative with justification	Draft the recommendation narrative; this remains a human decision
8	**Tell Your Story**	Present the recommendation clearly to the decision-maker	Draft the policy memo, executive summary, or presentation deck

The AI-Assisted Policy Recommendation Workflow

Step 1 — Problem definition. Feed the AI your raw situational data — BDP chapters, ministry reports, constituent complaints, media coverage. Ask it to synthesize these into a **one-paragraph problem statement** that identifies the gap between the current situation and the desired outcome.

Step 2 — Evidence assembly. Upload your documents into a context-rich AI session. Ask it to organize the evidence into categories: quantitative data, qualitative findings, legal provisions, and stakeholder positions. Have it flag evidence gaps where you need additional research.

Step 3 — Alternative construction. Ask the AI to generate four to five distinct policy options based on the evidence. Require it to include the **status quo** as one option (this is the baseline against which all alternatives are measured). Each option should be described in one paragraph with its core mechanism and expected coverage.

> **Sample Prompt — Policy Alternatives:**
>
> ``` Based on the following problem statement and evidence summary, generate 5 policy alternatives for addressing [POLICY PROBLEM] in BARMM.
>
> Requirements: 1. Alternative 1 must be "Status Quo" — describe what happens if the Bangsamoro Government takes no new action 2. Alternatives 2-5 must be distinct approaches, not variations of the same approach 3. Each alternative must specify: the mechanism (what action is taken), the implementing body, the estimated cost range, and the timeline 4. At least one alternative must be achievable within existing BAA authority (no new legislation required) 5. At least one alternative must involve new legislation
>
> Problem statement: [Paste your refined problem statement]
>
> Evidence summary: [Paste your organized evidence]
>
> Mark any cost estimate as [ESTIMATE - VERIFY WITH MFBM]. ```

Steps 4-6 — Criteria, projections, and trade-offs. Ask the AI to build a **decision matrix** with alternatives as rows and criteria as columns. Have it score each alternative on a 1-5 scale, then generate the trade-off analysis. The human analyst reviews and adjusts the scores based on institutional knowledge the AI does not have — particularly **political feasibility** and **administrative capacity**, which depend on relationships and conditions that documents cannot fully capture.

Steps 7-8 — Decision and storytelling. The recommendation itself is a human decision. AI cannot weigh political risk, assess stakeholder power dynamics, or account for the Chief Minister's priorities beyond what is written in public documents. But once the decision is made, AI excels at **drafting the policy memo** that communicates it. Feed it the decision matrix, the selected alternative, and the justification. Ask it to draft in the format the decision-maker expects.

> **Sample Prompt — Policy Recommendation Memo:**
>
> ``` Draft a policy recommendation memo for [DECISION-MAKER TITLE] on [TOPIC].
>
> Format: 1. EXECUTIVE SUMMARY (1 paragraph, max 100 words) 2. PROBLEM STATEMENT (from our analysis) 3. ALTERNATIVES CONSIDERED (summarize all 5 in 1 paragraph each) 4. EVALUATION (present the decision matrix) 5. RECOMMENDATION (state the selected alternative and justify) 6. IMPLEMENTATION STEPS (numbered, with timeline and responsible office) 7. BUDGETARY IMPLICATIONS (cite specific sources for all figures)
>
> Decision matrix and selected alternative: [Paste the matrix and your chosen option]
>
> Mark any unverified data as [VERIFY]. All legal citations must reference specific section numbers. ```

BARMM-Specific Considerations for Policy Recommendations

Policy recommendations in the Bangsamoro context must address dimensions that generic policy analysis frameworks may overlook:

- **BOL compliance.** Does the recommended action fall within the enumerated powers of the Bangsamoro Government under Article V, Section 2? If it requires intergovernmental coordination, cite Article VI.[^24]
- **Shari'ah alignment.** Does the recommendation affect areas governed by Islamic personal law (marriage, inheritance, family, property relations among Muslims)? If so, note this and recommend consultation with the Shari'ah High Court or Islamic legal scholars.[^25]
- **BDP alignment.** Map the recommendation to specific goals, strategies, and targets in the Bangsamoro Development Plan 2023-2028. The BDP identifies six overarching development goals and eight cross-cutting strategies.[^26]
- **Transition context.** BARMM remains in the transition period under the third BTA (2025-present) with elections scheduled under RA 12064.[^27] Any recommendation must account for the transition timeline and the institutional continuity requirements that come with it.
- **Moral governance.** The Chief Minister's governance framework emphasizes 12 pillars of moral governance. Policy recommendations gain traction when they explicitly align with these pillars.[^28]

Summary

This chapter covered AI's role across the full legislative and policy cycle in BARMM. The core workflow is consistent throughout:

1. **Prepare context** — feed the AI your source documents, the BAA index, and the relevant BOL provisions
2. **Prompt precisely** — use the structured prompts in this chapter as templates, adapted to your specific task
3. **Review critically** — every AI output must be verified against the actual enacted text, not just summaries
4. **Refine iteratively** — the first AI draft is a starting point, not a final product

AI does not replace the legislative researcher, the bill drafter, or the policy analyst. It makes each of them faster, more thorough, and less likely to miss a cross-reference or a conflict. The decisions — what to legislate, what to recommend, how to vote — remain yours.

For the complete procedural framework behind every topic in this chapter, refer to the *Bill Drafting Guidebook for the Bangsamoro Parliament*.[^29] For the AI-assisted CSW templates with section-by-section prompts, see Appendix F of this guidebook.

AI for Program Implementation and Service Delivery

Plans do not serve people. Implemented programs do. The Bangsamoro Government has produced strategic plans, enacted 89 Bangsamoro Autonomy Acts, and appropriated billions in annual budgets.[^1] Yet the persistent challenge is not planning — it is execution. Programs stall between approval and delivery. Procurement documents sit incomplete for weeks. Job descriptions copy-paste from templates that do not match actual functions. Press releases announce programs that constituents never hear about. Coordination memoranda circulate without follow-up tracking.

This is the **implementation gap**, and it is where AI delivers some of its most practical value. Unlike the strategic tasks covered in Chapters 5 through 7, the work in this chapter is operational. It is the daily grind of project management, procurement paperwork, human resource actions, government correspondence, and intergovernmental coordination. These tasks consume the majority of staff time across BARMM's 15 line ministries, 10 attached agencies, 4 commissions, and the Office of the Chief Minister.[^2]

AI does not implement programs. People do. But AI eliminates the documentation bottlenecks that slow people down. A procurement officer who spends four days drafting a technical specification can produce a compliant first draft in four hours. A human resource officer who manually screens 200 applications against BAA 17 qualification standards can reduce initial screening to a single afternoon.[^3] A communications officer who writes the same advisory format for every program launch can generate tailored drafts for each audience in minutes.

This chapter maps AI onto six implementation domains. Each section provides the operational context, specific AI techniques, sample prompts, and verification protocols. Cross-references point to the *MOP Formulation Guidebook for BARMM Ministries, Offices, and Agencies* for procedural standards and the *Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region* for the management layer above these tasks.[^4]

8.1 From Approved Plan to Implemented Program — The Implementation Gap in BARMM

Every approved program follows a path from authorization to delivery. That path runs through multiple offices, requires dozens of documents, and involves coordination across agencies that may not share systems, timelines, or even terminology. Understanding this path — and where it breaks down — is the starting point for applying AI effectively.

The Implementation Chain

A typical BARMM program moves through these stages after legislative or executive approval:

1. **Program design** — The implementing ministry or agency translates the approved plan into a detailed work plan with activities, timelines, targets, and budgets.
2. **Budget release** — The Ministry of Finance, and Budget and Management (MFBM) releases the allocated funds through allotment orders and notices of cash allocation.
3. **Procurement** — The ministry's Bids and Awards Committee (BAC) or the OCM Procurement Service procures the goods, services, or infrastructure the program requires.
4. **Staffing** — The ministry fills positions or reassigns personnel to handle the program.
5. **Execution** — Field staff deliver the program to beneficiaries.
6. **Reporting** — The ministry reports progress to the Bangsamoro Planning and Development Authority (BPDA), the BTA Parliament, and oversight bodies.

Where the Gap Opens

The gap opens between stages 1 and 5. Specifically:

- **Work plans lack specificity.** Approved plans state outcomes but not the operational steps to reach them. Staff must translate "improve maternal health outcomes in island provinces" into procurement schedules, deployment orders, training calendars, and supply chain logistics — without templates or guidance.
- **Procurement documentation delays everything.** A single incomplete Purchase Request can delay an entire program quarter. Technical specifications, market surveys, and terms of reference require specialized drafting that most program staff have not been trained to do.
- **Staffing actions move slowly.** Creating new positions, reclassifying existing ones, or processing appointments requires compliance with BAA 17 (Bangsamoro Civil Service Code) and CSC rules. Many offices lack HR staff trained in both BARMM-specific and national civil service requirements.
- **Coordination is informal.** Multi-agency programs rely on personal relationships rather than structured coordination mechanisms. When a key liaison transfers, institutional memory goes with them.

How AI Bridges Each Gap

Implementation Gap	Root Cause	AI Entry Point	What AI Produces
Vague work plans	Approved plans lack operational detail	Work plan generation from strategic objectives	Detailed activity matrices with timelines, responsible units, and resource requirements
Slow procurement	Staff lack technical writing skills for specifications	Procurement document drafting	Technical specifications, Terms of Reference, Purchase Requests, market survey templates
HR bottlenecks	BAA 17 compliance requires specialized knowledge	Job description and screening criteria generation	Position descriptions aligned to qualification standards, screening matrices, personnel action drafts
Weak communications	No dedicated comms staff in most offices	Correspondence and advisory drafting	Press releases, citizen advisories, internal memoranda, social media content
Fragmented coordination	No shared tracking systems across agencies	Coordination document generation and tracking matrices	MOAs, joint work plans, stakeholder matrices, status update templates
Incomplete reporting	Staff unsure what format or content is required	Report structure and narrative generation	Progress reports, accomplishment summaries, terminal reports

Table 8.1: Implementation Gaps with AI Entry Points

Every section that follows addresses one row of this table. Locate your current bottleneck and go directly to that section.

8.2 AI for Project Management and Coordination

Project management in BARMM operates without enterprise software in most offices. Staff track activities in spreadsheets, Word documents, or — in many cases — not at all. AI cannot replace project management software. But it can generate the documents that structure project execution and make tracking possible without specialized tools.

8.2.1 Work Plan Generation from Strategic Objectives

The starting point is always the approved plan. This may be a component of the Bangsamoro Development Plan 2023-2028, a ministry-level strategic plan, or a specific program approved by Parliament through an appropriation.[^5] The challenge: these plans state what to achieve, not how to achieve it.

Use AI to decompose strategic objectives into operational work plans.

> **Sample Prompt — Work Plan from Strategic Objective:**
>
> ``` You are a program management specialist for BARMM's Ministry of Health (MOH).
>
> The BDP 2023-2028 includes this goal: "Reduce maternal mortality ratio from 162 to 100 per 100,000 live births by 2028."
>
> Break this into an operational work plan for FY 2027 with: 1. Major activities (maximum 8) 2. Sub-activities under each major activity 3. Timeline (by quarter: Q1 Jan-Mar, Q2 Apr-Jun, Q3 Jul-Sep, Q4 Oct-Dec) 4. Responsible unit within MOH 5. Key deliverables per activity 6. Resource requirements (personnel, equipment, supplies) 7. Coordination requirements with other ministries or agencies (specify which)
>
> Use the BARMM organizational structure. MOH has provincial health offices in Lanao del Sur, Maguindanao del Norte, Maguindanao del Sur, Basilan, and Tawi-Tawi, plus city health offices in Cotabato City, Lamitan, and Marawi.
>
> Format as a table. ```

What to verify: AI will generate a plausible work plan, but it does not know your office's actual capacity, existing programs, or current staffing. Review every timeline against your real resource availability. Check whether the activities duplicate what another agency already does. Confirm that the coordination requirements name the correct BARMM agencies — not national agencies that have no BARMM counterpart.

8.2.2 Timeline and Milestone Tracking

Once you have a work plan, AI can generate milestone tracking documents.

> **Sample Prompt — Milestone Tracker:**
>
> ``` Convert this work plan into a milestone tracking sheet with: - Milestone name - Target completion date - Status column (Not Started / In Progress / Completed / Delayed) - Responsible officer (leave blank for manual filling) - Remarks column - RAG rating column (Red/Amber/Green based on timeline risk)
>
> Add conditional logic notes: mark as Amber if within 2 weeks of deadline with status still "In Progress"; mark as Red if past deadline with status not "Completed."
>
> [Paste work plan here] ```

This produces a tracking template you can maintain in a spreadsheet. Update it weekly. When you need a status report, feed the updated tracker back to AI and ask it to generate a narrative summary.

8.2.3 Cross-Agency Coordination Documents

Many BARMM programs require coordination across ministries. A school feeding program involves MBHTE (education), MAFAR (agriculture), MOH (nutrition), and MSSD (social welfare). AI can generate the coordination framework.

> **Sample Prompt — Multi-Agency Coordination Matrix:**
>
> ``` I am coordinating a school feeding program that involves four BARMM ministries: MBHTE, MAFAR, MOH, and MSSD.
>
> Create a coordination matrix with: 1. Each agency's specific role and deliverables 2. Shared milestones requiring joint action 3. Information flow: who reports what to whom, and when 4. Decision points that require multi-agency agreement 5. Escalation path when coordination breaks down
>
> Use the BARMM organizational structure where the OCM serves as the coordinating authority through the Bangsamoro Economic and Development Council (BEDC). ```

Cross-reference: The *MOP Formulation Guidebook* provides the standard operating procedures that underpin these coordination frameworks. If your ministry has a MOP, feed its relevant sections into AI context before generating coordination documents. If your ministry does not yet have a MOP, Chapter 3 of the *MOP Formulation Guidebook* explains how to develop one.[^6]

8.3 AI-Assisted Procurement Documentation

Procurement documentation is the single largest source of implementation delays in BARMM government. The problem is not the procurement law — Republic Act 9184 (Government Procurement Reform Act) and its IRR provide clear rules.[^7] The problem is that most program staff are not trained procurement specialists, yet they must produce the documents that initiate procurement. A missing technical specification, an incomplete Terms of Reference, or a weak justification can delay a program by an entire quarter.

AI does not replace the Bids and Awards Committee. It does not make procurement decisions. But it drafts the documents that procurement decisions depend on — faster and more completely than most non-specialist staff can do manually.

8.3.1 Purchase Request Justification

Every procurement starts with a Purchase Request (PR) that justifies why the item or service is needed. Weak justifications are the most common reason PRs get returned for revision.

> **Sample Prompt — Purchase Request Justification:**
>
> ``` You are a procurement support officer for the Ministry of Basic, Higher, and Technical Education (MBHTE) in BARMM.
>
> Draft a Purchase Request justification for the following:
>
> Item: 500 sets of Grade 7 mathematics textbooks (K-12 aligned, DepEd-approved edition) Purpose: Distribution to 25 secondary schools in Maguindanao del Sur with zero textbook inventory Requesting unit: Curriculum and Instruction Division Estimated cost: PHP 750,000 Fund source: BAA 85 (GAA FY 2026), MBHTE MOOE allocation
>
> The justification must: 1. State the specific need and the consequence of not procuring 2. Link to the BDP 2023-2028 education goals 3. Explain how the quantity was determined (beneficiary count, 1:1 textbook ratio target) 4. Reference the approved Annual Procurement Plan (APP) 5. Follow RA 9184 procurement documentation standards
>
> Keep the justification under 300 words. Use formal government language. ```

What to verify: Check that the fund source coding matches your actual allotment. Verify the unit cost against current market prices — AI does not have access to your agency's price monitoring data. Confirm the APP reference is accurate. Never submit AI-generated procurement documents without a BAC member's review.

8.3.2 Technical Specifications

Technical specifications describe exactly what the government wants to buy. Vague specifications lead to bid protests, failed procurements, and substandard deliveries.

> **Sample Prompt — Technical Specifications:**
>
> ``` Draft technical specifications for the following procurement:
>
> Item: Desktop computers for the BPDA Planning Division Quantity: 15 units Purpose: Data analysis, report generation, GIS mapping Budget ceiling: PHP 45,000 per unit
>
> Include: 1. Minimum hardware specifications (processor, RAM, storage, display) 2. Software requirements (must be compatible with government-standard applications) 3. Warranty requirements (minimum 3 years on-site) 4. Delivery timeline 5. Compliance requirements (PhilGEPS posting, RA 9184 provisions on technical specifications)
>
> Do NOT specify a particular brand. Use generic technical standards per RA 9184 Section 18 (Reference to Brand Names). ```

Critical rule: RA 9184, Section 18 prohibits reference to brand names in technical specifications.[^8] AI sometimes generates brand-specific language. Always review the output for brand references and replace them with generic performance standards.

8.3.3 Terms of Reference for Consulting Services

Terms of Reference (TOR) for consulting services are among the most complex procurement documents. They must specify the scope of work, deliverables, qualifications, timeline, and evaluation criteria — all while complying with RA 9184's provisions on consulting services.

> **Sample Prompt — Terms of Reference:**
>
> ``` Draft a Terms of Reference for the following consulting engagement:
>
> Client: Bangsamoro Planning and Development Authority (BPDA) Project: Development of a Bangsamoro Spatial Development Framework Duration: 6 months Budget: PHP 5,000,000
>
> The TOR must include: 1. Background and rationale (reference the BDP 2023-2028 and the need for spatial planning) 2. Objectives (3-5 specific, measurable objectives) 3. Scope of work (detailed task descriptions) 4. Expected deliverables with submission schedule 5. Qualification requirements for the consulting firm (experience, personnel, equipment) 6. Evaluation criteria and weights 7. Reporting requirements 8. Ownership of outputs
>
> Follow RA 9184 IRR Annex G (Terms of Reference for Consulting Services). Use formal procurement language. ```

Verification protocol: Have the BAC Secretariat review every AI-generated TOR against the RA 9184 IRR requirements before posting. Check that evaluation criteria weights comply with standard government procurement practice (typically 70% technical, 30% financial for consulting services, unless otherwise justified).

Case Study: MAFAR's AI-Assisted Procurement Package

The Ministry of Agriculture, Fisheries and Agrarian Reform (MAFAR) needed to procure 10,000 bags of certified rice seeds for distribution to farmers in Lanao del Sur and Maguindanao del Norte for the wet season planting. The program had been approved and funded under BAA 85, but the procurement package had stalled for three weeks because the Livelihood Division staff lacked experience writing technical specifications for agricultural inputs.

A program officer used AI to draft three documents simultaneously:

1. **Purchase Request justification** linking the procurement to BDP Goal 4 (Sustainable and Inclusive Economy) and the approved Annual Procurement Plan
2. **Technical specifications** covering seed variety, germination rate, moisture content, packaging standards, and PhilSeed certification requirements — all without brand references
3. **Delivery schedule and inspection criteria** specifying staggered delivery to provincial warehouses with lot-by-lot quality inspection protocols

The AI-generated drafts took two hours to produce. The BAC Technical Working Group reviewed and revised them in one day. The procurement package was posted on PhilGEPS within the same week — compared to the three-week delay that preceded the AI intervention.

What the human added: The BAC TWG corrected the germination rate standard (AI used a generic standard; the TWG applied the PhilSeed-specific standard for inbred rice). The delivery schedule was adjusted to match actual warehouse availability, which AI had no way to know. The fund source coding was verified against the actual allotment release.

Lesson: AI produced a 90% complete package. The specialist review caught the 10% that required institutional knowledge. Without AI, the 90% would have taken weeks. Without human review, the 10% would have caused procurement failure.

8.4 AI for Human Resource Management

Human resource management in BARMM operates under a dual legal framework: BAA 17 (Bangsamoro Civil Service Code) governs the regional civil service, while national CSC rules and the Omnibus Rules on Appointments apply concurrently.[^9] This creates a documentation burden that AI can significantly reduce.

8.4.1 Job Descriptions and Position Classification

Every position in the Bangsamoro Government requires a position description that aligns with qualification standards. AI can generate draft position descriptions from basic inputs.

> **Sample Prompt — Position Description:**
>
> ``` You are an HR specialist for a BARMM ministry.
>
> Draft a Position Description Form (CSC Form) for the following position:
>
> Position title: Planning Officer III Salary grade: SG-18 Office: Bangsamoro Planning and Development Authority (BPDA), Policy and Plan Formulation Division
>
> Include: 1. Position summary (2-3 sentences) 2. Key duties and responsibilities (8-10 items, in order of frequency/importance) 3. Education requirement (per CSC Qualification Standards) 4. Experience requirement 5. Training requirement 6. Eligibility requirement 7. Competency requirements (core, organizational, leadership/technical) 8. Working conditions
>
> The duties must reflect actual planning work in a regional autonomous government: development plan formulation, program monitoring, stakeholder coordination, data analysis, and report preparation.
>
> Align with BAA 17 (Bangsamoro Civil Service Code) Article 4, which requires the merit and fitness system and prohibits discrimination based on age, religion, culture, ethnicity, gender, disability, or political affiliation. ```

What to verify: Cross-check the qualification standards against the current CSC Qualification Standards Manual. AI may generate outdated eligibility requirements. Confirm the salary grade matches the DBM-approved plantilla. Verify that the duties listed match your agency's actual functional structure — not a generic government template.

Common AI errors in position descriptions: AI tends to generate duties that are too generic ("performs other tasks as assigned") or too aspirational ("leads strategic transformation initiatives" for a mid-level position). Direct AI to match the **salary grade level** to the **complexity of duties**. An SG-18 position performs supervised professional work, not executive-level strategy. Also watch for AI inserting national government agency names where BARMM agency names belong — for example, "coordinate with NEDA" when the correct counterpart is BPDA.

8.4.2 Application Screening and Shortlisting

When a BARMM office receives dozens or hundreds of applications for a single position, screening against qualification standards is time-consuming. AI can accelerate initial screening — but only for the **documentary review stage**, never for the assessment of qualifications that require human judgment.

> **Sample Prompt — Screening Matrix:**
>
> ``` I received 45 applications for a Planning Officer III position (SG-18) at BPDA.
>
> Create a screening matrix with these columns: 1. Applicant name 2. Education (meets minimum: Yes/No/Needs verification) 3. Experience (meets minimum: Yes/No — specify years claimed) 4. Training (meets minimum: Yes/No — specify hours claimed) 5. Eligibility (type of eligibility claimed) 6. Additional qualifications noted 7. Overall screening result: QUALIFIED / NOT QUALIFIED / FOR VERIFICATION 8. Remarks
>
> Qualification standards for SG-18 Planning Officer III: - Education: Bachelor's degree relevant to the job - Experience: 2 years relevant experience - Training: 8 hours relevant training - Eligibility: Career Service Professional or equivalent
>
> [Paste applicant summary data here] ```

Critical safeguard: AI screening is a **documentary convenience**, not a decision. The Human Resource Merit Promotion and Selection Board (HRMPSB) must independently verify all qualifications. BAA 17, Article 3, requires that "appointments in the civil service are made with equality according to merit and fitness." No AI output substitutes for the HRMPSB's deliberation.[^10]

8.4.3 Personnel Action Documents

Personnel actions — appointments, promotions, transfers, reassignments, and separations — each require specific documentation. AI can draft these documents from basic inputs.

> **Sample Prompt — Appointment Paper Draft:**
>
> ``` Draft the following personnel action documents for a new appointment:
>
> Type: Original appointment Appointee: [Name] Position: Administrative Officer V, SG-18 Office: Ministry of the Interior and Local Government (MILG), Administrative Division Nature of appointment: Permanent Date of appointment: [Date]
>
> Generate: 1. Appointment paper (CS Form No. 33-A format) 2. Position Description Form summary 3. Oath of Office text 4. Certification of assumption to duty template
>
> Reference BAA 17 provisions on appointments (Book II, Appointments and Other Personnel Actions). Include the attestation requirements per CSC rules. ```

What to verify: All personnel action documents must be reviewed by the agency's HRMO and attested by the CSC. AI-generated drafts serve as starting points. Check every detail: fund availability, plantilla item number, salary step, and the specific BAA 17 provisions cited.

8.4.4 Training Needs Assessment and Individual Development Plans

BAA 17 mandates a "progressive system of human resource administration."[^10a] Part of that system is ensuring employees receive training that matches their roles. AI can generate Individual Development Plans (IDPs) from position requirements and performance evaluation results.

> **Sample Prompt — Individual Development Plan:**
>
> ``` Generate an Individual Development Plan for a Planning Officer III (SG-18) at BPDA who received a "Satisfactory" IPCR rating with the following development areas flagged by the supervisor:
>
> 1. Needs improvement in data visualization and GIS mapping
> 2. Needs improvement in report writing (narrative quality)
> 3. Strong in stakeholder coordination but needs project management methodology training
>
> Create an IDP with: - 3 development objectives (linked to duties in the PD) - Specific training interventions for each (internal, external, or self-directed) - Timeline for completion (within 12 months) - Success indicators for each objective - Supervisor's monitoring checkpoints (quarterly)
>
> Reference the Development Academy of the Bangsamoro (DAB) as the primary training provider for BARMM employees. ```

Cross-reference: The *Supervision and Supervisory Development Guidebook* covers the supervisor's role in coaching, performance management, and staff development in detail. Chapters on performance monitoring and competency assessment provide the management context for the HR documents generated here.[^13a]

8.5 AI for Government Communications

Communications is the most underinvested function across BARMM agencies. Most ministries do not have dedicated communications officers. The Bangsamoro Information Office (BIO) handles centralized communications, but individual ministries and offices produce their own internal and external communications — often with staff who have no communications training.[^11]

AI fills this gap by drafting communications products from program information. This is one area where AI's speed-to-draft advantage is enormous: the same officer who takes a full day to write a press release can generate a polished first draft in 15 minutes.

8.5.1 Official Correspondence

Government correspondence follows rigid formatting conventions. AI can generate letters, memoranda, and endorsements from minimal inputs.

> **Sample Prompt — Official Memorandum:**
>
> ``` Draft an official memorandum with the following details:
>
> From: Minister, Ministry of Social Services and Development (MSSD) To: All Provincial Social Welfare Officers, BARMM Subject: Implementation Guidelines for the Emergency Assistance Program, FY 2027 Date: [Current date]
>
> Key points to cover: 1. Program was approved under BAA 85 (GAA FY 2026) with a total allocation of PHP 150 million 2. Each province will receive allocation based on poverty incidence data 3. Target beneficiaries: families affected by natural disasters and armed conflict displacement 4. Provincial offices must submit their distribution plans within 30 days 5. Reporting requirements: monthly utilization reports to MSSD Central Office
>
> Use formal Philippine government memorandum format. Reference specific legal authorities. Keep the tone directive but collegial. ```

8.5.2 Press Releases and Public Advisories

Every BARMM program launch, milestone, or achievement deserves public communication. AI can generate press releases that follow standard media format.

> **Sample Prompt — Press Release:**
>
> ``` Write a press release for the Bangsamoro Information Office (BIO) about the following event:
>
> Event: MAFAR launches the Bangsamoro Fisheries Development Program in Tawi-Tawi Date: [Date] Location: Bongao, Tawi-Tawi Key details: - Program provides motorized bancas, fishing gear, and post-harvest facilities to 500 fisherfolk cooperatives - Total investment: PHP 200 million from BAA 85 allocation - Target beneficiaries: 5,000 registered fisherfolk in 11 municipalities of Tawi-Tawi - Aligned with BDP Goal 4 (Sustainable and Inclusive Economy)
>
> Include a quote placeholder for the MAFAR Minister. Include a quote placeholder for a beneficiary representative.
>
> Format: standard press release (headline, dateline, lead, body, boilerplate). Maximum 500 words. ```

What to verify: Confirm all figures, dates, and program names against official records. AI may generate plausible but inaccurate statistics. Every quote placeholder must be filled with actual quotes from the named official — never leave AI-generated quotes in the final version. Verify that the fund source attribution is correct before publication.

8.5.3 Citizen Advisories and Social Media Content

BARMM serves communities across five provinces, three cities, and 63 special geographic area barangays.[^12] Many of these communities have limited access to traditional media. Social media — particularly Facebook — is the primary information channel for many Bangsamoro citizens.

> **Sample Prompt — Citizen Advisory (Multilingual):**
>
> ``` Create a citizen advisory for the following:
>
> Program: Free civil registration (birth certificates) for unregistered Bangsamoro citizens Implementing agency: MILG in coordination with LGUs Where: Municipal halls in all Lanao del Sur municipalities When: March 15-30, 2027 Requirements: Any government-issued ID, barangay certification, 2 witnesses Cost: Free (funded by BARMM government)
>
> Generate: 1. A formal written advisory (English, 200 words) 2. A social media post version (conversational Filipino, 150 words, suitable for Facebook) 3. Key information in bullet format for radio reading (30-second script)
>
> The social media version should be accessible to citizens with basic literacy. Avoid bureaucratic language. ```

8.5.4 Internal Communications and Knowledge Sharing

Beyond external communications, AI can improve how information flows within a ministry. Directives from the Minister's office, policy updates, and procedural changes must reach every division and field office. AI can convert a dense policy document into a clear internal brief.

> **Sample Prompt — Internal Policy Brief:**
>
> ``` The Chief Minister issued Executive Order No. [XX] requiring all BARMM ministries to submit their updated Strategic Performance Management Systems (SPMS) by [date].
>
> Convert this executive order into an internal brief for division chiefs at MSSD that explains: 1. What the EO requires (in plain language) 2. What each division must submit 3. Deadline and submission format 4. Who to contact with questions 5. Consequences of non-compliance
>
> Maximum 1 page. Use numbered action items. Assume the audience has not read the full EO. ```

This is a pattern you can reuse for any internal directive. Feed the original document to AI, specify the audience and their knowledge level, and ask for a translation into actionable instructions. This saves every division chief the time of parsing the original document and guessing what it requires of them.

Cross-reference: The *Supervision and Supervisory Development Guidebook* addresses how supervisors should manage their teams' communications outputs, including review and approval workflows for public-facing documents.[^13]

8.6 AI for Intergovernmental Coordination

The Bangsamoro Government operates within an **asymmetrical relationship** with the national government.[^14] This means coordination happens in three directions: vertically with national agencies, horizontally across BARMM ministries, and downward with constituent local government units. Each direction produces its own documentation requirements.

8.6.1 Interagency Memoranda of Agreement

When two or more BARMM agencies collaborate on a shared program, a Memorandum of Agreement (MOA) or Memorandum of Understanding (MOU) formalizes the arrangement. AI can draft these from basic partnership parameters.

> **Sample Prompt — Interagency MOA:**
>
> ``` Draft a Memorandum of Agreement between the following BARMM agencies:
>
> Party A: Ministry of Basic, Higher, and Technical Education (MBHTE) Party B: Ministry of Science and Technology (MOST)
>
> Purpose: Joint implementation of the Bangsamoro STEM Education Enhancement Program
>
> Key terms: 1. MBHTE provides: 50 target schools, teacher participants, curriculum integration support, classroom facilities 2. MOST provides: STEM equipment and laboratory kits, technical trainors, assessment tools 3. Duration: 2 years (FY 2027-2028) 4. Funding: Each party funds its own contributions from respective MOOE allocations under BAA 85 5. Coordination: Joint Technical Working Group meets monthly 6. Reporting: Quarterly joint progress reports to BPDA 7. Dispute resolution: Escalation to OCM through the Cabinet Secretariat
>
> Use standard Philippine government MOA format: WHEREAS clauses, articles, signatures. Reference the Bangsamoro Administrative Code (BAA 13) as the legal framework for inter-agency cooperation. ```

What to verify: Every MOA must be reviewed by the legal offices of both agencies before execution. AI-generated WHEREAS clauses may cite provisions that do not exist. Verify every legal reference. Confirm that both agencies' heads have the authority to sign — some MOAs require authorization from a higher authority (Minister or Chief Minister).

8.6.2 National-Bangsamoro Coordination Documents

Coordination with national agencies requires particular care. The BOL's intergovernmental relations provisions (Article VI) define the framework, but the practical mechanics are still evolving.[^15] AI can help draft coordination documents that properly frame BARMM's autonomous status.

> **Sample Prompt — National-BARMM Coordination Memo:**
>
> ``` Draft a letter from the BARMM Chief Minister's Office to the Department of Agriculture (DA) National Office proposing a joint implementation arrangement for the National Rice Resiliency Program within BARMM territory.
>
> Key points: 1. Under BOL Article V, agriculture is within BARMM's exclusive powers 2. MAFAR is the implementing agency for agriculture programs in BARMM 3. The proposal is for DA to channel program funds through MAFAR rather than implementing directly 4. Cite the asymmetrical relationship principle (BAA 13, Sec. 3(a)) 5. Propose a Joint Implementing Agreement with clear roles 6. Express willingness to adopt DA technical standards while maintaining BARMM's implementation authority
>
> Tone: respectful, firm on autonomy principles, cooperative. This is a negotiation document, not a directive. ```

Critical guidance: National-BARMM coordination documents are politically sensitive. AI generates the structure and language, but the policy positions must come from authorized officials. Never send an AI-generated national coordination document without clearance from the Chief Minister's Office or the relevant Minister.

8.6.3 Multi-Stakeholder Tracking

Complex programs involve dozens of stakeholders — government agencies, LGUs, civil society organizations, development partners, and beneficiary groups. Tracking who is responsible for what, and whether they have delivered, is a coordination task that AI can structure.

> **Sample Prompt — Stakeholder Tracking Matrix:**
>
> ``` Create a stakeholder tracking matrix for the Bangsamoro Peace and Development Communities Program with these stakeholder categories:
>
> 1. Lead agency: MSSD
> 2. Co-implementing agencies: MILG, MAFAR, MPW
> 3. Supporting agencies: BPDA (M&E), MFBM (fund release)
> 4. LGU partners: 5 target municipalities in Maguindanao del Norte
> 5. Civil society partners: 3 community-based organizations
> 6. Development partners: UNDP, World Bank
>
> For each stakeholder, include: - Specific commitments/deliverables - Timeline for each deliverable - Contact person column (leave blank) - Status column - Last update date - Escalation flag (Yes/No)
>
> Format as a table. Add a section at the bottom for tracking coordination meetings (date, attendees, key decisions, follow-up actions). ```

Maintenance protocol: A tracking matrix is only useful if updated regularly. Assign one staff member as the **coordination focal person**. Feed updated matrix data back to AI monthly to generate coordination status reports for management. This converts raw tracking data into narrative summaries that decision-makers can act on.

8.6.4 LGU Coordination and Devolution Support

The Bangsamoro Government exercises authority over its constituent LGUs — provinces, cities, municipalities, and barangays — while respecting their guaranteed autonomy under the BOL and BAA 13.[^15a] Programs that require LGU-level implementation need coordination documents that spell out what the regional ministry provides and what the LGU is expected to contribute.

> **Sample Prompt — Ministry-to-LGU Implementation Letter:**
>
> ``` Draft a letter from the MILG Regional Director to all Municipal Mayors in Basilan Province regarding the implementation of the Bangsamoro Community-Driven Development Program.
>
> Key points: 1. Program background and legal basis 2. Each municipality's allocation and matching fund requirement 3. Required LGU actions: designation of focal person, creation of Municipal Project Management Team, submission of community priority list 4. Timeline: all requirements due within 45 days 5. Technical assistance available from MILG Provincial Office 6. Reporting line: Municipal focal person reports to MILG Provincial Director, who consolidates for regional reporting to BPDA
>
> Tone: directive but supportive. Acknowledge that LGUs have varying capacities. Offer technical assistance. ```

What to verify: Confirm that the program's legal basis is correctly cited. Check that allocation amounts match actual fund releases. Verify the LGU names and current officials — municipal leadership changes can make letters addressed to the wrong official counterproductive.

Bringing It All Together: The AI-Augmented Implementation Cycle

The six domains covered in this chapter — project management, procurement, HR, communications, and intergovernmental coordination — are not separate workflows. They are interconnected stages of the same implementation cycle. A new program requires a work plan (Section 8.2), procurement for materials (Section 8.3), staffing (Section 8.4), public communication about the launch (Section 8.5), and coordination with partner agencies (Section 8.6).

AI's value multiplies when you use it across the full cycle rather than in isolated tasks. **Build context continuity.** When you generate a work plan for a program, save that AI conversation. When you later draft procurement documents for the same program, load the work plan into AI's context so the procurement justification aligns with the work plan language. When you draft the press release for the program launch, load both the work plan and procurement specifications so the public communication accurately describes what was procured and why.

Three principles govern AI use across all implementation tasks:

1. **AI drafts; humans decide.** Every document in this chapter requires human review before it carries official weight. Procurement documents need BAC review. Personnel actions need HRMPSB and CSC attestation. Intergovernmental documents need executive clearance. AI accelerates drafting, not decision-making.

2. **Verify against authoritative sources.** AI does not have access to your latest allotment release, your current plantilla, your approved Annual Procurement Plan, or your agency's internal policies. Every AI output must be verified against your office's actual records.

3. **Build institutional templates.** The first time you use AI for a procurement justification, save the reviewed and approved version as a template. Feed it to AI the next time with the instruction: "Follow the format, structure, and compliance language of this approved template." Over time, your office builds a library of AI-compatible templates that produce increasingly accurate first drafts.

The *MOP Formulation Guidebook* provides the procedural foundation for all implementation workflows described here.[^16] If your ministry has not yet developed its MOP, the implementation tasks in this chapter will still work — but they will work better when em-

bedded within a documented operational framework. Chapter 9 takes the next step: measuring whether these implemented programs are actually achieving their intended outcomes.

09

AI for Monitoring and Evaluation

Monitoring and evaluation is where governance meets evidence. Every program the Bangsamoro Government launches generates data — budget utilization rates, beneficiary counts, output targets, outcome indicators, and compliance milestones. The 2nd Bangsamoro Development Plan 2023-2028 sets macroeconomic targets across eight domains: GRDP growth at 8-9% annually, poverty incidence reduced to 20-25%, unemployment held at 3-5%, and gross capital formation raised to 18-20% of GRDP.[^1] Behind each target sits a results chain — from ministry PPAs to regional outcomes — and behind each results chain sits an M&E system that must track, compare, report, and feed back into planning.

The problem is not a lack of data. It is a lack of capacity to process what exists. Quarterly reports from 27 ministries, offices, and agencies pile up. Budget utilization rates go unreported until COA deadlines arrive. Performance indicators from the BDP sit in spreadsheets that no one synthesizes across ministries. The M&E function in BARMM is understaffed, overworked, and buried in manual data processing.

This chapter shows you how AI transforms M&E from a bottleneck into an accelerator. You will learn how to use AI for performance monitoring, program evaluation, reporting and compliance, data visualization, and the feedback loop that connects M&E data back to the planning cycle covered in Chapter 5. Every technique uses real BARMM data structures and reporting requirements.

> **Cross-reference:** This chapter complements the *Strategic Planning Guidebook for the Bangsamoro Government*, which covers M&E frameworks within the 10-Point Strategic Planning Framework.[^2] For Completed Staff Work procedures for producing M&E reports, see the *CSW Guidebook for the Bangsamoro Government*.[^3]

9.1 Why M&E Is the Most AI-Ready Governance Function

Not all governance functions benefit equally from AI. Legislative drafting requires legal judgment. Policy formulation requires political context. Budgeting requires negotiation. But M&E is fundamentally a **data processing function**. It collects structured data, compares it against targets, identifies deviations, generates reports, and feeds findings back into decision-making. Every one of these steps matches what AI does well.

Three Characteristics That Make M&E AI-Ready

First, M&E is data-heavy. A single ministry produces quarterly physical and financial reports, semi-annual accomplishment reports, annual performance reviews, and ad hoc reports for the Office of the Chief Minister. Multiply that by 27 entities. The Ministry of Finance, Budget, and Management (MFBM) consolidates financial data from all entities quarterly.[^4] The Bangsamoro Planning and Development Authority (BPDA) tracks BDP indicator progress across all six development goals.[^5] AI can ingest, compare, and synthesize these volumes in minutes rather than weeks.

Second, M&E is pattern-dependent. The value of M&E lies in detecting trends, anomalies, and deviations. A budget utilization rate of 42% in Q2 means nothing in isolation. It means something when compared against the Q2 average of 68% across all ministries, or against the same ministry's Q2 rate of 71% last year. AI excels at this kind of comparative pattern detection across large datasets.

Third, M&E is reporting-intensive. M&E staff spend most of their time writing reports — not analyzing data. They copy numbers from spreadsheets into narrative sections, format tables, draft findings, and write recommendations. AI can generate first drafts of these narrative sections from raw data, freeing analysts to focus on interpretation and judgment.

Table 9.1: M&E Tasks Ranked by AI Readiness

Rank	M&E Task	AI Readiness	Why	Human Role
1	**Data consolidation across sources**	Very High	Merging spreadsheets and extracting numbers from reports is mechanical	Verify data accuracy; resolve discrepancies between sources
2	**Variance analysis (actual vs. target)**	Very High	Comparing numbers against benchmarks and flagging deviations is pure computation	Interpret *why* a variance occurred; assess whether it matters
3	**Report narrative drafting**	Very High	Converting data tables into narrative	Review for accuracy; add institutional

Rank	M&E Task	AI Readiness	Why	Human Role
			paragraphs follows repeatable patterns	context the data does not show
4	**Trend detection across time periods**	High	Identifying upward, downward, or stagnating patterns over quarters or years	Determine whether a trend reflects policy impact or external factors
5	**Cross-ministry comparison**	High	Ranking and comparing performance across entities using standard indicators	Account for differences in mandate scope, staffing, and operating conditions
6	**Compliance checklist verification**	High	Checking whether reports contain all required sections and attachments	Verify the substance behind the checked boxes
7	**Indicator definition and framework design**	Medium	AI can propose indicator frameworks, but definitions require domain expertise	Ensure indicators measure what matters, not what is easy to count
8	**Lessons learned synthesis**	Medium	AI can extract patterns from evaluation reports, but insights require judgment	Distinguish actionable lessons from generic observations
9	**Stakeholder feedback analysis**	Medium	AI can categorize and theme qualitative feedback at scale	Weigh feedback against community context and

Rank	M&E Task	AI Readiness	Why	Human Role
				power dynamics
10	**Evaluation design and methodology**	Low	Evaluation design requires methodological expertise and contextual judgment	Select methods appropriate to the program, budget, and timeline
11	**Causal attribution**	Low	Determining *what caused* an outcome requires research design, not text analysis	Design and interpret counterfactual analysis
12	**Political interpretation of findings**	Very Low	AI has no access to political dynamics, stakeholder relationships, or power structures	Decide what to emphasize, de-emphasize, or recommend based on findings

Use this table to prioritize where to introduce AI into your M&E workflow. Start at the top — data consolidation and variance analysis — where AI readiness is highest and human judgment is least at risk. Move down the table only as your team builds confidence in AI-assisted M&E.

9.2 AI-Assisted Performance Monitoring

Performance monitoring tracks whether programs are delivering outputs on schedule and within budget. In BARMM, performance monitoring operates at three levels: **ministry-level** (each entity tracks its own PPAs), **BDP-level** (BPDA tracks progress against the six development goals), and **budget-level** (MFBM tracks financial utilization against appropriations).

KPI Tracking with AI

Every ministry maintains **Key Performance Indicators (KPIs)** — quantitative measures tied to planned outputs and outcomes. A ministry of health tracks immunization coverage rates, maternal health facility visits, and hospital bed-to-population ratios. A ministry of education tracks enrollment rates, completion rates, and classroom-to-student ratios. Each KPI has a **baseline**, a **target**, and **periodic actuals** reported quarterly.

AI adds value by automating the comparison between actuals and targets across multiple KPIs simultaneously.

> **Sample Prompt — KPI Dashboard Analysis:**
>
> ``` You are an M&E analyst for the Bangsamoro Government.
>
> I will provide you with a ministry's KPI tracking table for FY 2026 Q1-Q2. The table has these columns: KPI Name, Baseline (FY 2025), Annual Target (FY 2026), Q1 Actual, Q2 Actual, Cumulative Actual, and Target Achievement Rate.
>
> Analyze this data and produce: 1. A ranked list of KPIs by achievement rate (lowest first) 2. KPIs that are ON TRACK (cumulative actual >= 50% of annual target by mid-year) 3. KPIs that are AT RISK (cumulative actual is 30-49% of annual target by mid-year) 4. KPIs that are OFF TRACK (cumulative actual < 30% of annual target by mid-year) 5. For each OFF TRACK KPI, flag the gap in absolute numbers and percentage points 6. A narrative summary suitable for a management briefer (max 300 words)
>
> Mark any interpretation beyond the numbers as [ANALYST NOTE]. Do not speculate on causes — only report what the data shows.
>
> [Paste KPI table here] ```

Flagging Underperformance

The most valuable AI contribution to performance monitoring is **automated flagging**. Instead of reading through dozens of KPI tables manually, feed your data to AI and ask it to surface only the items that need attention.

The threshold approach. Define performance thresholds before running the analysis. For example:

- **Green:** Target achievement rate at 50% or above by mid-year (on track)
- **Yellow:** Target achievement rate between 30% and 49% by mid-year (at risk)
- **Red:** Target achievement rate below 30% by mid-year (off track)

Ask AI to apply these thresholds to every KPI in the dataset and produce a one-page exception report showing only Yellow and Red items. This exception report becomes your management briefing document.

> **Sample Prompt — Exception Report:**
>
> ``` Apply the following thresholds to the KPI data I provided: - GREEN: Achievement rate >= 50% of annual target - YELLOW: Achievement rate 30-49% of annual target - RED: Achievement rate < 30% of annual target
>
> Produce an exception report showing ONLY Yellow and Red KPIs. Format as a table with columns: KPI Name, Status (Yellow/Red), Cumulative Actual, Annual Target, Achievement Rate, Gap.
>
> After the table, draft a 200-word management alert summarizing the top 3 areas of concern. Use direct language. No hedging. ```

Performance Dashboards

AI cannot build interactive dashboards on its own. But it can **prepare the data and narrative elements** that feed into dashboards built in spreadsheet tools, Google Data Studio, or presentation software.

Ask AI to organize your KPI data into dashboard-ready formats:

- **Summary statistics** for each ministry (total KPIs, % on track, % at risk, % off track)
- **Ranked lists** of top-performing and bottom-performing indicators
- **Quarter-over-quarter comparisons** showing whether performance improved or declined
- **Narrative callouts** for each section of the dashboard (2-3 sentences per ministry summarizing the key story)

These outputs become the content layer of your dashboard. The visual design and interactivity are separate — but the analytical substance comes from AI-processed data.

9.3 Program Evaluation with AI

Performance monitoring tells you *what happened*. Program evaluation tells you *what it means* — whether a program achieved its intended outcomes, why or why not, and what should change.

Synthesizing Evaluation Data

Program evaluations in BARMM draw from multiple data streams: project completion reports, beneficiary surveys, field monitoring visit reports, financial statements, third-party assessments, and mid-term reviews. An evaluation team for a single program may need to synthesize 50 or more documents before drafting findings.

AI compresses this synthesis phase. Upload your evaluation documents into a context-rich session. Ask AI to extract and organize the raw findings before you begin interpretation.

> **Sample Prompt — Evaluation Data Synthesis:**
>
> ``` You are assisting a program evaluation for [PROGRAM NAME] implemented by [MINISTRY/OFFICE] under the Bangsamoro Government.
>
> I will upload [NUMBER] documents including: - Project completion reports - Beneficiary survey results - Financial utilization reports - Field monitoring visit reports
>
> For each document, extract: 1. Key findings (quantitative and qualitative) 2. Reported outputs vs. planned outputs 3. Challenges and bottlenecks identified 4. Recommendations made by the report authors
>
> Organize all extracted data into a master findings matrix with rows for each finding and columns for: Source Document, Finding Category (Output/Outcome/Process/Financial), Finding Statement, Supporting Data, and Confidence Level (High/Medium/Low based on how many sources corroborate).
>
> Do not interpret the findings. Only organize them. ```

Drafting Evaluation Reports

After synthesis, AI can draft the evaluation report sections that follow repeatable structures. Most evaluation reports in government follow a standard format: executive summary, background, methodology, findings, conclusions, recommendations, and annexes.

The two-pass approach:

1. **First pass — findings to conclusions.** Feed AI the organized findings matrix. Ask it to group related findings into themes, identify patterns, and draft conclusion statements. Each conclusion must be traceable to specific findings.
2. **Second pass — conclusions to recommendations.** Feed AI the conclusions. Ask it to draft actionable recommendations. Each recommendation must specify *who* should act, *what* action to take, *when* it should happen, and *how* success will be measured.

What AI cannot do in evaluation: AI cannot determine causation. It cannot tell you whether a vaccination program increased immunization rates *because of* the program or because of other factors (a national campaign, improved road access, a health crisis that motivated parents). Causal attribution requires evaluation designs — randomized controlled trials, quasi-experimental methods, or at minimum a theory-based evaluation with a credible counterfactual.[^6] AI can help you draft the theory of change and organize the evidence. The methodological judgment remains yours.

Lessons Learned Extraction

Every evaluation should produce **lessons learned** — actionable insights that improve future program design. AI assists by scanning evaluation reports and extracting statements that qualify as lessons.

Define what qualifies as a lesson before asking AI to extract them:

- A lesson must describe **what happened**, **why it happened**, and **what to do differently**
- A lesson must be **specific enough to act on** (not “coordination should be improved” but “monthly inter-ministry coordination meetings reduced duplication of livelihood grants in Lanao del Sur by 40%”)
- A lesson must be **transferable** to other programs or contexts

Ask AI to scan your evaluation documents and extract only statements that meet all three criteria. Then review the extracted lessons for accuracy and relevance.

9.4 AI for Reporting and Compliance

Quarterly Reports

BARMM ministries submit quarterly physical and financial accomplishment reports to BPDA and MFBM. These reports follow standard formats but require significant manual effort to compile. A typical quarterly report includes:

- **Physical accomplishment** — outputs delivered against planned targets
- **Financial utilization** — obligations and disbursements against allotments
- **Narrative explanation** — why targets were met, partially met, or unmet
- **Issues and challenges** — bottlenecks encountered during the quarter
- **Proposed corrective actions** — what the ministry will do differently next quarter

AI can draft the narrative sections (items 3-5) from the data in items 1-2. Feed AI your physical and financial data tables. Ask it to generate the narrative explanation for each program or PPA.

> **Sample Prompt — Quarterly Report Narrative:**
>
> ``` Draft the narrative section of a quarterly accomplishment report for [MINISTRY NAME], Q2 FY 2026.
>
> Physical accomplishment data: [Paste physical data table]
>
> Financial utilization data: [Paste financial data table]
>
> For each PPA, write: 1. A 2-3 sentence status summary stating whether the target was met, partially met, or unmet 2. The utilization rate as a percentage 3. If underperformance occurred, a factual description of the gap (do not speculate on causes — I will add those) 4. If overperformance occurred, note it and flag for verification
>
> Use the format: "[PPA Name]: [Status]. [Details]." Keep each entry under 75 words. Mark any section where you need additional information as [DATA NEEDED]. ```

COA Compliance

The Commission on Audit (COA) audits all BARMM entities annually. COA audit observations result in **Notices of Disallowance (ND)**, **Notices of Suspension (NS)**, and **Notices of Charge (NC)** when deficiencies are found.[^7] Common audit findings in

BARMM include: delayed liquidation of cash advances, incomplete supporting documents for disbursements, non-compliance with procurement law (RA 9184), and gaps between planned and actual fund utilization.[^8]

AI assists COA compliance in two ways:

Pre-audit self-assessment. Before COA arrives, run your financial records through an AI-assisted checklist. Feed AI the COA audit observation patterns from prior years and ask it to flag areas in your current records that match those patterns.

Audit response preparation. When COA issues observations, your office must respond with a management comment explaining the deficiency and the corrective action taken. AI can draft these management comments from your supporting documents.

> **Sample Prompt — COA Management Comment:**
>
> ``` COA has issued the following audit observation for [MINISTRY NAME], FY 2025:
>
> "[Paste the audit observation text]"
>
> Based on the following supporting documents and corrective actions we have taken: [Describe the documents and actions]
>
> Draft a management comment that: 1. Acknowledges the finding without admitting liability 2. Explains the context that led to the deficiency 3. Lists specific corrective actions already taken (with dates) 4. Identifies preventive measures to avoid recurrence 5. Maintains a professional, factual, non-defensive tone
>
> Keep the comment under 300 words. Do not use legal conclusions. Mark any factual claim you cannot verify as [VERIFY]. ```

BDP Progress Reporting

BPDA coordinates the monitoring of BDP 2023-2028 progress across all entities. Each ministry reports on the BDP indicators that fall within its mandate. These indicators map to the six development goals and eight strategies.[^9]

AI adds the most value in BDP progress reporting when it **cross-references ministry-level data against BDP-level targets**. Feed AI the BDP macroeconomic targets table (see Table 9.2 below) alongside ministry-level accomplishment data. Ask it to identify which ministry outputs contribute to which BDP targets and whether the collective output is on track.

Table 9.2: BDP 2023-2028 Macroeconomic Targets — AI Monitoring Reference

Indicator	Baseline	End-of-Plan Target	Source	AI Monitoring Application
GRDP Annual Growth Rate	7.5% (2020-2021)	8-9% for six years	PSA	Track quarterly GRDP estimates against trajectory
GRDP Per Capita Growth Rate	6.4% (2020-2021)	6-9%	PSA	Compare against population growth rate for net gains
Industry/ Services Growth	Industry 7.9%, Services 6.6%	10-12%	PSA	Flag if any sector falls below double-digit target
Gross Capital Formation (% of GRDP)	16.91% (2021)	18-20% by 2028	PSA	Monitor infrastructure spending trends quarterly
Inflation Rate	2.40% (2021)	2-4%	PSA	Alert if inflation exceeds upper bound
Unemployment Rate	3.80% (2021)	3-5%	PSA	Cross-reference with MOLE employment program outputs
Underemployment Rate	9.0% (2020)	4-7%	PSA	Requires quality-of-employment data beyond headcounts
Poverty Incidence	29.80% (2021)	20-25% by 2028	PSA	Track against MHSD and MSSD

Indicator	Baseline	End-of-Plan Target	Source	AI Monitoring Application
				intervention coverage

Source: 2nd Bangsamoro Development Plan 2023-2028, Chapter 4.[^10]

Feed this table into your AI session alongside quarterly data updates from PSA and ministry reports. Ask AI to calculate whether current trends are on trajectory to meet end-of-plan targets. For indicators published annually (like poverty incidence), ask AI to project based on interim proxy indicators that are available more frequently.

9.5 Data Visualization and Presentation

Raw data does not move decision-makers. Charts, tables, and infographics do. But M&E staff spend hours formatting data into visual presentations manually. AI cannot generate finished infographics, but it can prepare every element that goes into one.

Charts and Tables from Raw Data

When you have a dataset, ask AI to recommend the appropriate visualization type and prepare the data in the format that visualization tool requires.

Chart type selection rules:

Data Type	Best Visualization	When to Use
One KPI over time	Line chart	Tracking a single indicator across quarters or years
Multiple KPIs at one point in time	Bar chart (horizontal)	Comparing performance across ministries or programs
Budget breakdown	Stacked bar or pie chart	Showing how a total is divided among components
Target vs. actual	Bullet chart or paired bar	Showing gaps between planned and achieved
Geographic distribution	Choropleth map	Showing variation across BARMM provinces and cities
Correlation between two indicators	Scatter plot	Exploring relationships (e.g., spending vs. outcomes)
Process flow	Sankey diagram	Showing how funds flow from appropriation to utilization

Ask AI to organize your data into the format required by your visualization tool. If you use Google Sheets, ask AI to output comma-separated values ready for import. If you use a presentation tool, ask AI to produce a formatted table with the key figures highlighted.

> **Sample Prompt — Visualization-Ready Data:**
>
> ``` I have the following raw data on budget utilization rates across 16 BARMM ministries for FY 2026 Q1-Q2:
>
> [Paste raw data]
>
> Prepare this data for: 1. A horizontal bar chart ranking ministries by utilization rate (highest to lowest) 2. A summary table showing: Ministry Name, Allotment, Obligations, Disbursements, Utilization Rate, and a Status column (Green/Yellow/Red per our thresholds) 3. Three key findings to display as callout boxes on the dashboard (one sentence each, factual, no hedging)
>
> Format the bar chart data as a two-column CSV (Ministry, Utilization Rate). ```

Narrative for Presentation Slides

Decision-makers read presentations, not spreadsheets. AI can draft the talking points and narrative captions that accompany your charts in a presentation.

For each chart or table, ask AI to produce:

- A **title** that states the finding, not just the topic (e.g., “Budget utilization dropped 12 percentage points from Q1 to Q2” rather than “Budget Utilization Rates”)
- A **one-sentence takeaway** that tells the audience what the chart means
- A **two-sentence context note** that explains what is normal and what is unusual
- A **recommended action** if the chart shows underperformance

This approach ensures your presentations carry analysis, not just data.

Case Study: Quarterly Utilization Rates Across 16 Ministries

Background. The MFBM consolidates budget utilization data from all BARMM ministries each quarter. For FY 2026 Q2, the data showed significant variation in obligation rates across the 16 ministries under the Bangsamoro Government.

The manual process. An M&E analyst at BPDA received the raw MFBM data in a consolidated spreadsheet with columns for allotment, obligations, disbursements, and unobligated balance for each ministry. The analyst spent three days preparing a comparative report: manually calculating utilization rates, ranking ministries, drafting narrative findings, and formatting charts for a management briefing to the Office of the Chief Minister.

The AI-assisted process. The same analyst fed the MFBM spreadsheet data into an AI session using the following prompt:

```
Analyze the following FY 2026 Q2 budget utilization data for 16 BARMM ministries.

For each ministry, calculate: - Obligation rate (obligations / allotment x 100) - Disbursement rate (disbursements / allotment x 100) - Unobligated balance as % of allotment

Then produce: 1. A ranked table of ministries by obligation rate (lowest first) 2. The mean, median, and standard deviation of obligation rates 3. Ministries below one standard deviation from the mean (flagged as significantly underperforming) 4. A 250-word narrative summarizing the top 3 findings suitable for a management briefer to the Chief Minister's office 5. Three recommended follow-up actions for underperforming ministries

Use direct language. No hedging. Mark any assumption as [ASSUMPTION].

[Paste data here]
```

Result. AI produced the ranked table, statistical summary, flagged underperformers, and narrative draft in under five minutes. The analyst reviewed the output, corrected one ministry name, added context about a ministry that had a low obligation rate due to a delayed procurement caused by a COA audit suspension (information that was not in the spreadsheet data), and finalized the briefer in two hours instead of three days.

The takeaway. AI compressed the mechanical work — calculation, ranking, formatting, and first-draft narrative — from three days to five minutes. The analyst's expertise was redirected to the two hours of contextual review and institutional knowledge that AI cannot provide. The briefer reached the Chief Minister's office a full week earlier than the previous quarter's report.

9.6 The Feedback Loop: From M&E Data to Plan Revision

M&E data that does not feed back into planning is wasted effort. The governance cycle described in Chapter 1 is a closed loop: plan, budget, implement, monitor, evaluate, and revise the plan.[^11] This section focuses on the last connection — how AI helps translate M&E findings into planning inputs.

Connecting M&E Back to Planning (Chapter 5)

Chapter 5 covered AI for strategic planning and development.[^12] That chapter showed how to use AI for environmental scanning, situational analysis, and plan formulation. The feedback loop closes when M&E data becomes the raw material for the next planning cycle's situational analysis.

The specific connections:

M&E Output	Planning Input	AI Role
KPI achievement rates	Revised targets for next fiscal year	Calculate realistic targets based on historical achievement trajectories
Underperformance flags	Priority areas for resource reallocation	Rank underperforming PPAs by impact potential and resource requirements
Evaluation findings	Program design revisions	Map findings to specific program components that need redesign
Lessons learned	Planning assumptions	Update the assumptions in your Theory of Change based on field evidence
BDP progress data	Mid-term plan adjustments	Identify goals that are off-track and require strategy changes
COA audit findings	Internal control improvements	Translate recurrent audit observations into process reform proposals

The Plan Revision Prompt

When M&E data accumulates enough to warrant a plan revision, use AI to prepare the analytical foundation.

> **Sample Prompt — M&E to Plan Revision:**
>
> ``` You are a strategic planner for [MINISTRY NAME] in the Bangsamoro Government.
>
> I will provide: 1. The ministry's current strategic plan summary (goals, strategies, PPAs, and targets) 2. M&E data from the past [NUMBER] quarters covering KPI achievement, budget utilization, and evaluation findings 3. COA audit observations relevant to this ministry
>
> Analyze the M&E data against the current plan and produce:
>
> A. GAP ANALYSIS: Which planned outputs and outcomes are significantly below target? Quantify each gap. B. ROOT CAUSE HYPOTHESES: For each gap, suggest 2-3 possible causes based on the data patterns. Mark each as [HYPOTHESIS - VERIFY WITH STAFF]. C. RECOMMENDED PLAN ADJUSTMENTS: - PPAs to scale up (performing well, high impact) - PPAs to redesign (underperforming, design flaws indicated) - PPAs to discontinue (no evidence of impact, low utilization) - New PPAs to propose (gaps in current portfolio) D. REVISED TARGETS: For each KPI, propose a revised target based on historical achievement rates. Show the calculation.
>
> Align all recommendations with the relevant BDP 2023-2028 development goals and strategies.
>
> [Paste plan summary, M&E data, and audit observations] ```

The CSW Connection

Every M&E-driven recommendation that reaches a decision-maker should follow **Completed Staff Work (CSW)** standards. The *CSW Guidebook for the Bangsamoro Government* documents the ADDRESS IT methodology — seven steps from analyzing context through sustaining implementation.[^13] M&E data feeds directly into three of these steps:

- **Analyze context** — M&E data provides the evidence base for understanding the current situation
- **Research** — evaluation findings and lessons learned are primary research inputs for the CSW analyst
- **Sustain implementation and iterate** — ongoing monitoring data drives the continuous improvement loop that CSW demands

When preparing a CSW document based on M&E findings, use AI to organize the evidence into the CSW format. Feed it the M&E data, the specific decision you want the authority to make, and the CSW template. AI will structure the document. You supply the judgment, the recommendation, and the institutional context that makes the CSW persuasive.

Closing the Loop with BDP Alignment

The 2nd BDP identifies six overarching development goals and eight cross-cutting strategies.[^14] Every M&E finding should trace back to at least one of these goals. When M&E reveals a gap, the planning question is: which BDP goal is this gap undermining, and which strategy should address it?

The six goals as an M&E lens:

1. **Stable, just, and accountable government** — Monitor governance indicators: staffing rates, internal audit compliance, transparency scores, citizen satisfaction
2. **Equitable, competitive, and robust economy** — Monitor economic indicators: GRDP growth, employment rates, poverty incidence, investment levels
3. **Peaceful, safe, and resilient communities** — Monitor peace and security indicators: conflict incidents, displacement rates, disaster response times
4. **Inclusive, responsive, and quality social services** — Monitor service delivery indicators: enrollment rates, health coverage, social welfare beneficiary counts
5. **Rich and diverse culture preserved and recognized** — Monitor cultural preservation indicators: heritage site maintenance, cultural event participation, indigenous knowledge documentation
6. **Strategic, adequate, and climate-resilient infrastructure** — Monitor infrastructure indicators: road completion rates, facility construction, climate resilience measures

Ask AI to map your M&E findings to these six goals. This mapping exercise ensures that your M&E reports speak the language of the BDP and connect operational data to strategic outcomes.

> **Sample Prompt — BDP Alignment Mapping:**
>
> ``` Map the following M&E findings to the six BDP 2023-2028 development goals:
>
> BDP Goals: 1. Stable, just, and accountable government 2. Equitable, competitive, and robust economy 3. Peaceful, safe, and resilient communities 4. Inclusive, responsive, and quality social services 5. Rich and diverse culture preserved and recognized 6. Strategic, adequate, and climate-resilient infrastructure
>
> M&E Findings: [Paste your findings list]
>
> For each finding, identify: - The primary BDP goal it affects - The secondary BDP goal (if applicable) - The relevant BDP strategy (from the 8 strategies) - Whether the finding indicates PROGRESS or REGRESSION toward the goal - A one-sentence implication for the next planning cycle
>
> Present as a table with one row per finding. ```

The Annual M&E-to-Planning Calendar

Timing matters. M&E data must arrive before planning deadlines, or it arrives too late to matter. Here is the annual cycle:

Month	M&E Activity	Planning Activity It Feeds
January-March	Q4 and annual report compilation	Year-end performance review
April-May	Annual evaluation synthesis	Budget proposal preparation for next FY
June-July	Mid-year review (Q1-Q2 data)	Mid-year plan adjustments
August-September	COA audit response preparation	Internal control improvements
October-November	Q3 data consolidation	Strategic plan annual update
December	Year-end data collection launch	Planning assumptions for next FY

AI can manage this calendar by generating **monthly checklists** based on the reporting requirements of the period. Feed AI your ministry's complete reporting calendar. Ask it to produce a monthly task list with deadlines, responsible units, and the planning decision each report feeds into.

Summary

M&E is where AI delivers its most immediate and measurable productivity gains in BARMM governance. The work is data-heavy, pattern-dependent, and reporting-intensive — three characteristics that match AI's core strengths.

The workflow is consistent across all M&E tasks:

1. **Feed AI the data** — raw numbers, spreadsheet exports, report documents
2. **Ask for structured analysis** — rankings, comparisons, variance flags, trend detection
3. **Request draft narratives** — report sections, management briefers, presentation talking points
4. **Review and add context** — institutional knowledge, political dynamics, field realities that data cannot capture
5. **Close the loop** — connect findings to the planning cycle through CSW documents and BDP alignment

AI compresses the mechanical work from days to minutes. Your expertise goes to the interpretation, judgment, and decision-making that no algorithm can replace. The result is faster reporting, earlier warnings, and M&E data that actually reaches decision-makers in time to matter.

AI for Oversight and Accountability

The Bangsamoro Parliament holds both legislative and oversight powers.[^1] This dual mandate means Parliament does not just enact laws — it watches how those laws are implemented, questions the executive when implementation falls short, and demands accountability when public funds are misspent. BOL Article VII, Section 5(d) grants Parliament the power to "conduct inquiries in aid of legislation in accordance with its rules."[^2] BOL Article VII, Section 41 declares the foundational principle: "Public office is a public trust. Public officers and employees shall at all times be accountable to the people."[^3]

Oversight is the mechanism that gives that principle teeth.

Yet oversight is one of the most resource-intensive functions in any parliament. It requires tracking hundreds of enacted laws, monitoring executive compliance, analyzing audit reports, reviewing procurement records, examining budget execution data, and preparing committee inquiries — all with the same staff who also draft legislation, prepare briefers, and manage constituency affairs. The Bangsamoro Parliament has enacted 89 BAAs since 2019.[^4] Each one created implementation obligations. Each one requires monitoring. The oversight gap is not a question of will. It is a question of capacity.

AI narrows that gap. It does not exercise oversight — that is a political function belonging to elected Members of Parliament. But it processes the raw material of oversight faster than any staff team can manage manually. It scans audit reports for recurring findings. It flags anomalies in procurement data. It converts dense financial statements into citizen-readable summaries. It preserves institutional knowledge across leadership transitions. And it prepares the analysis that enables Parliament to ask the right questions during committee hearings.

This chapter maps AI onto every stage of the oversight cycle, from audit analysis through formal parliamentary action. It gives you specific prompts, BARMM-grounded examples, and the accountability chain that connects AI-generated analysis to formal oversight outcomes.

10.1 Parliament's Oversight Function and AI — Strengthening Without Replacing

The Constitutional and Legal Basis

Parliament's oversight authority flows from three sources:

1. **The BOL itself.** Article VII, Section 5(d) grants the power of inquiry in aid of legislation. Section 27 requires that "no public money...shall be spent without an appropriations law clearly defining the purpose for which it is intended."[^5] Section 41 establishes the public trust doctrine for all Bangsamoro officials.[^6]
2. **The Bangsamoro Administrative Code (BAA 13).** This code structures the bureaucracy and defines the accountability relationships between Parliament, the Office of the Chief Minister, and the 15 ministries.[^7]
3. **The Constitution.** Article XI of the 1987 Philippine Constitution establishes the principle that "public office is a public trust" and creates the constitutional framework for accountability across all levels of government.[^8]

What Oversight Involves

Parliamentary oversight in BARMM operates through several mechanisms:

Oversight Mechanism	What Happens	Key Output
Committee hearings	Standing committees invite ministry officials to explain implementation progress, budget execution, and policy compliance	Hearing minutes, committee findings
Budget review	Parliament examines the Chief Minister's proposed budget against actual expenditures from prior years	Budget analysis report, committee recommendations
Inquiry in aid of legislation	Parliament investigates specific issues to inform future legislation or amendments	Investigation report, proposed legislation

Oversight Mechanism	What Happens	Key Output
Annual appropriations review	Parliament examines how the prior year's GAA was executed before approving the next one	COA report analysis, implementation assessment
Executive reporting	Ministries submit implementation reports; Parliament reviews compliance	Compliance monitoring database
Question period	Members question ministers on the floor regarding their portfolio's performance	Questions on record, ministerial commitments

Where AI Enters — and Where It Does Not

AI enters at every stage that involves document processing, pattern recognition, data analysis, and draft preparation. AI can read a 200-page COA audit report and extract every finding related to a specific ministry in minutes. It can compare five years of budget execution data and flag ministries that consistently underspend by more than 20%. It can draft the committee chairperson's opening questions for a hearing based on the audit findings.

AI does not enter at the stage of political judgment. It does not decide which ministry to investigate. It does not determine whether an official's explanation is credible. It does not weigh political consequences of publishing a committee report. It does not vote on whether to recommend sanctions. Those decisions belong to Members of Parliament.

The principle is consistent throughout this guidebook: AI prepares the ground; humans make the call.

Table 10.1: Oversight Functions with AI Applications

Oversight Function	Manual Approach	AI-Assisted Approach	Human Decision Required
COA report analysis	Staff reads 200+ pages, extracts findings manually	AI scans report, categorizes findings by ministry and severity, flags recurring issues	Which findings to prioritize for committee action

Oversight Function	Manual Approach	AI-Assisted Approach	Human Decision Required
Budget execution monitoring	Spreadsheet comparison of allotments vs. obligations vs. disbursements	AI identifies underspending patterns, flags anomalies, generates trend analysis	Whether underspending signals poor capacity or deliberate non-compliance
Procurement review	Manual scanning of PhilGEPS postings and contract documents	AI flags unusual patterns: sole-source frequency, split contracts, timing clusters	Whether a pattern constitutes a violation requiring investigation
Legislative compliance tracking	Staff checks whether IRRs were promulgated within statutory deadlines	AI monitors deadlines across all 89 BAAs, generates compliance dashboard	What action to take when deadlines are missed
Institutional memory	Senior staff carry knowledge informally; knowledge leaves when they leave	AI-searchable knowledge base with tagged findings, decisions, and precedents	How to interpret historical context for current decisions
Public transparency	Staff manually writes summaries of legislative action	AI generates citizen-friendly versions of enacted laws, budget summaries, committee reports	What level of detail to disclose and when

10.2 AI-Assisted Audit Analysis — Parsing COA Reports

Why Audit Analysis Matters for BARMM

The Commission on Audit is the exclusive auditor of the Bangsamoro Government under BOL Article XII, Section 2.[^9] COA's annual audit reports are the single most important oversight document available to Parliament. They identify findings — observations where expenditures, transactions, or practices deviate from laws, rules, or regulations. They include management responses from the audited agencies. And they contain recommendations that the audited agencies are expected to implement.

The problem is volume. A COA annual audit report for a single ministry can run 150 to 300 pages. Across 15 ministries, executive offices, and attached agencies, Parliament's oversight committees face thousands of pages of audit findings each year. Staff who attempt to read every page quickly fall behind. Staff who skim risk missing the findings that matter most.

AI for COA Report Processing

Feed the COA report (or its relevant sections) into your AI tool. Ask it to extract, categorize, and prioritize the findings.

> **Sample Prompt — COA Report Extraction:**
>
> ``` You are a parliamentary oversight analyst for the Bangsamoro Parliament.
>
> I am uploading the COA Annual Audit Report for [MINISTRY NAME] for FY [YEAR]. Extract all audit findings and organize them as follows:
>
> For each finding: 1. Finding number and title 2. Amount involved (if stated) 3. Specific law, rule, or regulation violated 4. Summary of the finding in 2-3 sentences 5. Management response (accepted, partially accepted, or disputed — quote the key response) 6. COA recommendation 7. Status of prior year findings on the same issue (if noted)
>
> After extracting all findings, provide: - A severity ranking (high/medium/low) based on amount involved and systemic nature - A list of recurring findings (same issue appearing in multiple years) - A list of findings where management disputed COA's observation
>
> Mark any finding where the amount exceeds PhP 10 million as [HIGH PRIORITY]. ```

Identifying Recurring Findings

Recurring findings are the most telling indicator of systemic problems. A finding that appears once might be an error. A finding that appears three years running signals a structural failure in internal controls, capacity, or compliance culture.

> **Sample Prompt — Recurring Findings Analysis:**
>
> ``` Compare the following COA audit findings across three fiscal years for [MINISTRY NAME]:
>
> [Paste or upload FY 2023, FY 2024, FY 2025 findings]
>
> Identify findings that appear in two or more consecutive years. For each recurring finding: 1. Describe the finding 2. Note the amount involved each year (increasing, decreasing, or stable) 3. Summarize the management response each year 4. Assess whether COA's recommendation was implemented 5. Flag if the same recommendation was repeated without implementation
>
> Conclude with a list of the top 5 most persistent findings, ranked by frequency and amount. ```

Analyzing Management Responses

Management responses reveal whether an agency takes audit findings seriously. AI can categorize responses into three types: **accepted** (the agency agrees and commits to corrective action), **partially accepted** (the agency agrees in principle but disputes specific elements), and **disputed** (the agency disagrees with the finding). When an agency disputes a finding, that dispute becomes a potential item for committee questioning.

> **Sample Prompt — Management Response Analysis:**
>
> ``` From the COA audit report below, extract all management responses where the audited agency disputed or only partially accepted the finding.
>
> For each disputed or partially accepted finding: 1. State the finding 2. Quote the management response (verbatim or near-verbatim) 3. Assess whether the agency's response addresses the substance of COA's observation or merely offers procedural explanations 4. Draft one committee hearing question that a Member of Parliament could ask the agency head to test the response
>
> [Paste or upload the COA report] ```

10.3 AI for Transparency and Open Government

The BOL Mandate for Transparency

BOL Article XII, Section 2 requires the Bangsamoro Government to "implement transparency and accountability mechanisms consistent with open government practices and generally accepted financial management principles."[^10] BOL Article XII, Section 1 further requires that funds "shall be spent in a programmatic, transparent, performance-based, and phased manner."[^11] The Twelve Pillars of Moral Governance reinforce this through Pillar 2 (Accountability) and Pillar 3 (Transparency and Honesty).[^12]

These are not aspirational statements. They are legal requirements. AI makes compliance practical.

Citizen-Friendly Budget Summaries

The annual General Appropriations Act is one of the most important documents the Bangsamoro Parliament enacts. BAA 85 (GAA FY 2026), for example, allocates billions in public funds across ministries, offices, and special purpose funds.[^13] But the GAA is written in technical budget language. A barangay captain who wants to know how much the Bangsamoro Government allocated for health in their province will not find the answer quickly by reading the enacted text.

AI can translate technical budget documents into plain-language summaries accessible to citizens, LGU officials, civil society organizations, and media.

Sample Prompt — Citizen Budget Summary:

```` You are a public information officer for the Bangsamoro Parliament.

Convert the following budget allocation table from [BAA NUMBER] (GAA FY [YEAR]) into a citizen-friendly summary that a barangay captain with no accounting background can understand.

Requirements: 1. Use plain language — no jargon 2. Explain what each major allocation means in practical terms (e.g., "PhP X billion for the Ministry of Health means funding for [specific programs]") 3. Compare with the prior year's allocation where data is available 4. Highlight the three largest increases and the three largest decreases 5. Include a simple table showing each ministry's total budget

Format: 2-page maximum. Use short sentences. Bold the key numbers.

[Paste the budget allocation data] ```

## Citizen-Friendly Legislation Summaries

Every enacted BAA should have a plain-language summary available to the public. This is not current practice in most legislatures — including the Bangsamoro Parliament. AI makes it feasible by generating first drafts of summaries that staff can review and publish.

**Sample Prompt — Legislation Summary for Public:**

```` Summarize [BAA NUMBER AND TITLE] in plain language for a Bangsamoro citizen who is not a lawyer.

Requirements: 1. Explain what the law does in one paragraph 2. Identify who is affected by the law 3. List the three most important provisions, each explained in one sentence 4. Note the penalties for violations, if any, in plain terms 5. State when the law takes effect 6. Keep the summary under 500 words 7. Avoid legal jargon — if you must use a technical term, define it immediately

[Paste or upload the enacted BAA text] ```

## Open Data Dashboards

AI can generate the narrative layer for open data initiatives. If the Bangsamoro Government publishes budget execution data, procurement records, or legislative tracking databases, AI can produce the commentary that makes raw data meaningful.

This connects to **Chapter 4 (Data, Documents, and Knowledge Management)** and **Chapter 6 (AI for Budgeting and Public Finance)**, where building BARMM-specific knowledge bases and budget analysis workflows are covered in detail.

---

# 10.4 AI for Anti-Corruption and Compliance Monitoring

## The Framework

Corruption undermines every development goal in the Bangsamoro Development Plan 2023-2028.[^14] The BOL addresses this through multiple provisions: the public trust doctrine (Art. VII, Sec. 41), the prohibition against conflict of interest (Art. VII, Sec. 15), the prohibition against business and pecuniary interest (Art. VII, Sec. 16), the financial disclosure requirement (Art. VII, Sec. 14), and the requirement for statements of assets, liabilities, and net worth (Art. VII, Sec. 18).[^15] BAA 17 (Bangsamoro Civil Service Code) further establishes disciplinary standards for Bangsamoro public servants.[^16]

AI does not investigate corruption. It does not accuse anyone. It identifies **patterns in data** that warrant human review. The distinction is critical. An AI tool that flags a procurement anomaly is performing pattern detection. A committee chairperson who decides to investigate that anomaly is exercising oversight authority. The chain from detection to action must always pass through human judgment and due process.

## Procurement Pattern Analysis

Government procurement is the most common vector for corruption in any jurisdiction. Common patterns include: **contract splitting** (dividing a single procurement into smaller contracts to avoid competitive bidding thresholds), **sole-source clustering** (an unusual number of direct contracts going to the same supplier), **timing anomalies** (procurements rushed at the end of the fiscal year to exhaust remaining allotments), and **price inflation** (contract prices that exceed market rates by significant margins).

AI can scan procurement records for these patterns — but it cannot determine whether any individual pattern constitutes corruption. A cluster of year-end procurements might reflect delayed allotment releases, not fraud. A sole-source contract might be justified by genuine emergency. **The human analyst must investigate each flagged pattern before drawing conclusions.**

**Sample Prompt — Procurement Anomaly Scan:**

```` You are a procurement compliance analyst supporting the Bangsamoro Parliament's oversight function.

Analyze the following procurement records from [MINISTRY/OFFICE] for FY [YEAR]:

Flag any of the following patterns: 1. CONTRACT SPLITTING: Multiple contracts for similar goods or services awarded within 30 days that individually fall below the competitive bidding threshold but collectively exceed it 2. SUPPLIER CONCENTRATION: Any supplier receiving more than 3 contracts or more than 20% of total procurement value 3. TIMING ANOMALIES: Contracts awarded in the last 60 days of the fiscal year that exceed 30% of total annual procurement 4. PRICE VARIANCE: Contract amounts that exceed the approved budget for that procurement by more than 15%

For each flagged item: - Describe the pattern - List the specific contracts involved - State the amounts - Note: THIS IS A PATTERN FLAG, NOT AN ACCUSATION. Each flag requires investigation before any conclusion.

[Paste or upload procurement data] ```

## Compliance Monitoring Across BAAs

Parliament has enacted 89 BAAs. Many of these require implementing agencies to issue IRRs within specified deadlines, submit reports, establish offices, or take other compliance actions. Manually tracking compliance across 89 laws is impractical. AI can maintain a compliance monitoring framework.

**Sample Prompt — Legislative Compliance Tracker:**

```` From the following list of enacted BAAs, extract every provision that imposes a deadline, reporting requirement, or implementation obligation on a ministry or office.

For each obligation: 1. BAA number and section 2. The obligation (issue IRR, submit report, create office, etc.) 3. The deadline (if specified) 4. The responsible agency 5. Whether the deadline has passed (use today's date: [DATE])

Flag all obligations where the deadline has passed. Organize by ministry so each ministry's obligations appear together.

[Paste or upload BAA provisions] ```

**Case Study: Tracking IRR Compliance Across Priority Codes**

The Bangsamoro Parliament enacted four priority codes during the transition period: BAA 13 (Administrative Code, October 2020), BAA 17 (Civil Service Code, February 2021), BAA 18 (Education Code, May 2021), and BAA 35 (Electoral Code, 2023).[^17] Each code contains provisions requiring implementing rules and regulations (IRRs) within specified timeframes.

A parliamentary oversight analyst could use AI to extract every IRR-related provision from all four codes, identify the responsible implementing body for each, calculate whether the statutory deadline has passed, and generate a compliance status dashboard. Where IRRs remain unissued years after the statutory deadline, the analysis becomes the basis for a committee hearing.

**The AI workflow:** 1. Upload the full text of BAA 13, BAA 17, BAA 18, and BAA 35 2. Prompt the AI to extract all provisions containing the phrases “implementing rules,” “IRR,” “rules and regulations,” or “within [number] days/months” 3. Generate a table: BAA | Section | Obligation | Deadline | Responsible Body | Status 4. Cross-reference with publicly available information on which IRRs have been promulgated 5. Present the compliance gap to the relevant committee

**What the AI cannot do:** Determine *why* an IRR was not issued. The delay might reflect genuine policy complexity, intergovernmental coordination requirements under BOL Article VI, resource constraints, or institutional resistance. The committee investigation answers those questions — AI identifies the questions worth asking.

# 10.5 AI for Institutional Memory and Transition Safeguarding

## The Transition Problem

BARMM has operated under three successive BTA compositions since 2019.[^18] Each transition brought new appointments, shifted committee assignments, and risked the loss of institutional knowledge accumulated by outgoing staff and officials. The transition from the first BTA to the second BTA in September 2022, and from the second to the third in March 2025, tested whether governance gains could survive leadership changes.

This challenge will intensify when the first parliamentary elections occur. Elected Members of Parliament will replace appointed BTA members. Some institutional knowledge holders will leave. Committee chairs will change. New staff will arrive unfamiliar with the legislative history behind the 89 enacted BAAs.

**Institutional memory is the difference between a government that learns from experience and one that repeats mistakes.** AI can encode that memory into searchable, accessible knowledge bases that survive personnel changes.

## Building an Oversight Knowledge Base

An oversight knowledge base captures the accumulated findings, decisions, precedents, and institutional context that oversight work generates. Without such a base, every new committee chair starts from zero. With it, a new chair can search for "COA findings related to MAFAR procurement" and retrieve five years of audit observations, committee hearing minutes, management responses, and follow-up actions.

> **Sample Prompt — Knowledge Base Structure:**
>
> ``` Design a knowledge base structure for the Bangsamoro Parliament's oversight function. The knowledge base must capture:
>
> 1. AUDIT FINDINGS: Organized by ministry, fiscal year, finding type, amount, and resolution status
> 2. COMMITTEE ACTIONS: Hearing dates, witnesses called, commitments made, follow-up deadlines
> 3. LEGISLATIVE COMPLIANCE: IRR status, reporting compliance, deadline tracking for all 89 BAAs
> 4. PROCUREMENT RECORDS: Flagged patterns, investigation outcomes, supplier histories
> 5. BUDGET EXECUTION: Allotment vs. obligation vs. disbursement trends by ministry, by year
> 6. INSTITUTIONAL CONTEXT: Key decisions, policy positions, intergovernmental agreements that affect oversight interpretation
>
> For each category, define: - Required fields (what data must be captured) - Tagging taxonomy (how entries are categorized for search) - Retention period (how long entries are kept) - Access levels (who can view, who can edit)
>
> The knowledge base must be searchable by keyword, ministry, fiscal year, BAA number, and finding type. ```

## Transition-Proofing Governance Gains

The BDP 2023-2028 identifies governance improvement as a core development goal. [^19] Every governance gain — a new internal control procedure, a procurement reform, a transparency initiative — is vulnerable to reversal during transitions if it exists only in the memory of the people who implemented it.

AI helps by converting institutional knowledge from informal, person-dependent form into structured, searchable, transferable form. When a committee secretary retires, the knowledge base they helped build remains. When a new committee chair takes over, they inherit not just a title but a documented institutional history.

Practical steps:

- **Document committee decisions.** After every committee hearing, use AI to convert raw minutes into structured records: findings, commitments, deadlines, responsible parties.
- **Tag everything.** Apply consistent tags (ministry, BAA number, fiscal year, topic) so future users can find what they need.

- **Write transition briefers.** Before a leadership change, use AI to generate a comprehensive briefer for the incoming chair: what the committee has done, what remains unfinished, what commitments were made and by whom.

> **Sample Prompt — Committee Transition Briefer:**
>
> ``` Prepare a transition briefer for the incoming Chairperson of the Committee on [COMMITTEE NAME] of the Bangsamoro Parliament.
>
> Include: 1. COMMITTEE MANDATE: What this committee oversees, per the Parliament's rules 2. LEGISLATION HISTORY: Bills and resolutions the committee has acted on during the [Nth] BTA period 3. OVERSIGHT ACTIONS: Hearings conducted, investigations initiated, reports published 4. PENDING MATTERS: Bills in committee, unresolved audit findings, unanswered commitments from ministry officials 5. KEY CONTACTS: Ministry counterparts, COA liaison, relevant NGO and CSO stakeholders 6. INSTITUTIONAL ISSUES: Recurring problems, capacity gaps, intergovernmental coordination challenges
>
> Source documents: [Paste or upload committee records, hearing minutes, and relevant audit findings] ```

---

# 10.6 The Accountability Chain: From AI Analysis to Formal Action

## Why the Chain Matters

AI-generated analysis has no legal force. A flagged procurement anomaly means nothing unless a committee acts on it. A recurring audit finding changes nothing unless Parliament demands corrective action. The value of AI in oversight depends entirely on what happens after the analysis is produced.

This section traces the **accountability chain** — the path from AI-generated insight to formal parliamentary action — and shows where AI supports each link.

## The Six Links

**Link 1: Detection.** AI scans audit reports, procurement data, budget execution records, or compliance tracking databases and identifies items that warrant attention. This is the raw material of oversight.

**Link 2: Verification.** Staff verify the AI output against original source documents. Does the flagged procurement anomaly actually appear in the records? Does the recurring audit finding match across multiple years? Are the numbers accurate? **Never present AI-generated findings to a committee without manual verification.** See Chapter 3 (AI-Augmented Workflow) for the verification protocol.

**Link 3: Preparation.** Staff prepare oversight documents for the committee: briefing papers, question lists, witness invitations, comparative analyses. AI drafts these documents. Staff review and refine them.

**Link 4: Committee action.** The committee hearing takes place. Witnesses testify. Members ask questions. Commitments are made on the record. AI is not present in the hearing room — but the preparation it enabled shapes the quality of the questions asked.

**Link 5: Follow-up.** After the hearing, AI tracks commitments: which agency promised what, by when. It generates follow-up alerts when deadlines pass without compliance. It drafts follow-up letters for the committee chairperson's signature.

**Link 6: Formal recommendation.** The committee produces a report with recommendations: amend a law, issue an IRR, impose administrative sanctions, refer a matter for investigation, or adjust the next year's appropriation. AI drafts the report. The committee approves it. Parliament acts on it.

## Table 10.2: The Accountability Chain

| Link | Actor | AI Role | Output |
|---|---|---|---|
| 1. Detection | AI + Staff | Primary: AI scans and flags | Flagged items list |
| 2. Verification | Staff | None: human verification required | Verified findings memo |
| 3. Preparation | Staff + AI | Supporting: AI drafts briefers and questions | Committee briefing package |
| 4. Committee action | Members of Parliament | None: political function | Hearing record, witness testimony |
| 5. Follow-up | Staff + AI | Supporting: AI tracks and alerts | Compliance tracker, follow-up letters |
| 6. Formal recommendation | Committee + Parliament | Supporting: AI drafts report | Committee report, resolution, legislative amendment |

## Drafting Committee Reports with AI

A committee report is the formal product of the oversight process. It summarizes findings, presents evidence, and recommends action. The *Bill Drafting Guidebook for the Bangsamoro Parliament*, Chapter 7, covers how a bill moves through the committee stage, including the committee report format.[^20] The same structural discipline applies to oversight committee reports.

> **Sample Prompt — Committee Oversight Report:**
>
> ``` Draft a committee oversight report for the Committee on [COMMITTEE NAME] of the Bangsamoro Parliament on the subject of [TOPIC].
>
> Structure: 1. BACKGROUND: Why the committee initiated this oversight action (cite the specific BAA, audit finding, or referral) 2. PROCEEDINGS: Summary of hearings conducted, witnesses heard, documents examined 3. FINDINGS: Numbered list of committee findings, each supported by specific evidence (audit observations, testimony, data) 4. ANALYSIS: Assessment of whether the audited agency complied with applicable laws, including [list specific BAAs] 5. RECOMMENDATIONS: Numbered list of recommended actions (corrective measures, legislative amendments, referrals for investigation, budget adjustments) 6. ANNEXES: List of documents reviewed
>
> Source documents: [Paste hearing minutes, audit findings, agency responses, and relevant BAA provisions]
>
> All recommendations must cite the specific legal basis (BAA section, BOL article, or national law provision). ```

## Connecting Oversight to Legislation

Oversight findings often reveal the need for new legislation or amendments to existing BAAs. A recurring COA finding about weak procurement controls might lead to a proposed amendment strengthening BAA 84 (Budget System Act) or introducing new procurement oversight provisions.[^21] A compliance tracking exercise might reveal that an enacted BAA lacks enforcement mechanisms, prompting an amendment to add penalties.

This is where Chapter 10 connects directly to **Chapter 7 (AI for Legislative and Policy Work)** and **Chapter 11 (Legislation and Codification)**. The oversight cycle feeds the legislative cycle. AI-generated oversight analysis becomes the evidence base for AI-assisted bill drafting. The accountability chain does not end with a committee report — it begins a new legislative cycle.

## Cross-References to Other Chapters

| Topic | Where to Go |
|---|---|
| AI-assisted bill drafting from oversight findings | Chapter 7, Section 7.3 |
| Budget execution analysis and AI tools | Chapter 6, Sections 6.3-6.5 |

| Topic | Where to Go |
|---|---|
| Building the BARMM knowledge base | Chapter 4, Section 4.3 |
| Codification and legal harmonization | Chapter 11 |
| Ethics of AI in oversight | Chapter 12, Section 12.3 |
| Committee report and committee hearing procedures | *Bill Drafting Guidebook*, Chapters 7 and 11 |
| Prompt library for oversight tasks | Appendix A, Section A.5 |

## Summary

Oversight is where governance proves itself honest. The Bangsamoro Parliament's oversight function — grounded in BOL Article VII, the public trust doctrine, and the Twelve Pillars of Moral Governance — demands rigorous, data-driven scrutiny of how public funds are spent and how laws are implemented. AI transforms the capacity for that scrutiny by processing audit reports, flagging procurement anomalies, tracking legislative compliance, generating transparency documents, and preserving institutional memory across leadership transitions.

But AI does not exercise oversight. It does not accuse. It does not judge credibility. It does not weigh political consequences. It does not sign committee reports. **Every link in the accountability chain passes through human judgment.** The analyst verifies. The staff prepares. The Member of Parliament questions. The committee recommends. Parliament acts.

The practical workflow for AI-assisted oversight follows the same pattern as every other chapter in this guidebook:

1. **Prepare context** — feed AI the relevant audit reports, procurement records, budget data, and enacted BAA provisions
2. **Prompt precisely** — use the structured prompts in this chapter, adapted to your specific oversight task
3. **Verify rigorously** — never present AI-generated findings to a committee without checking against original sources
4. **Connect to action** — every AI analysis should point toward a specific accountability outcome: a committee hearing question, a follow-up letter, a committee report recommendation, or a legislative amendment

The next chapter takes the product of both legislative and oversight work — the growing body of 89 BAAs — and addresses the challenge of codification: organizing, harmonizing, and maintaining the Bangsamoro legal corpus as it continues to grow.

---

# 11

# AI for Legislation and Codification

The Bangsamoro Transition Authority Parliament has enacted 89 Bangsamoro Autonomy Acts since February 2019.[^1] These 89 laws created ministries, established commissions, appropriated budgets, upgraded hospitals, founded municipalities, enacted priority codes, and defined the institutional architecture of the Bangsamoro Autonomous Region. They are the single most tangible product of the transition period.

But 89 separate enactments do not make a legal system. A legal system requires **codification** — the organization of enacted laws into a coherent, internally consistent, searchable body of legislation. It requires **harmonization** — the identification and resolution of conflicts between provisions enacted at different times, under different political conditions, by different BTA compositions. And it requires **maintenance** — the continuous updating of the legal corpus as new laws are enacted, old provisions are amended, and implementing rules fill in the operational detail.

The Bangsamoro Parliament has not yet completed this work. The transition period prioritized enactment speed — passing the laws BARMM needed to function. Codification, harmonization, and systematic maintenance received less institutional attention. This is not unusual for a new autonomous government. The challenge now is to build the systems that transform 89 discrete enactments into an organized, accessible, and internally consistent Bangsamoro legal corpus.

AI makes this work feasible at a scale and speed that manual methods cannot match. It does not replace the legal judgment required to resolve genuine policy conflicts between provisions. But it identifies those conflicts in minutes rather than months. It maps cross-references across dozens of laws simultaneously. It flags terminology inconsistencies that human reviewers miss after reading their fortieth BAA in a row. And it generates first drafts of implementing rules that legal staff can refine rather than build from scratch.

This chapter covers AI's role across the full post-enactment cycle: from organizing the existing legislative output through codification and harmonization, to drafting IRRs, to managing parliamentary operations, to closing the loop by feeding enacted legislation back into the planning process.

# 11.1 The Legislative Output of the BTA and What Comes Next

## What Parliament Has Enacted

The 89 BAAs fall into 13 domain categories.[^2] Understanding the distribution matters because codification must respect these domains while identifying the connections between them.

## Table 11.1: BAA Distribution by Domain

| Domain | Count | Key BAAs | Notes |
|---|---|---|---|
| **Budget & Appropriations** | 16 | BAA 3, 15, 23, 32, 65, 84, 85 | Annual GAAs, SDF extensions, supplemental budgets, Budget System Act |
| **Health** | 11 | BAA 21, 25-30, 73, 74, 76, 78-80 | Hospital upgrades and new facilities across all provinces |
| **Local Government** | 10 | BAA 41-48, 53-55, 70-71 | 11 new municipalities, mostly in Maguindanao and the SGA |
| **Electoral** | 5 | BAA 35, 58, 77, 86, 87-88 | Electoral Code, redistricting (77 struck down, 86 enacted), amendments |
| **Symbols & Identity** | 5 | BAA 1, 2, 7, 16, 20 | Flag, emblem, hymn, parliamentary seal, dual calendar |
| **Social Welfare & Human Rights** | 5 | BAA 4, 8, 10, 62, 64, 83, 89 | BHRC, BWC, BYC, IDP Protection, IP Rights, Nutrition Commission, Transitional Justice |

| Domain | Count | Key BAAs | Notes |
|---|---|---|---|
| **Governance & Administration** | 5 | BAA 5, 11, 13, 17, 37 | Attorney-General, appointments, Administrative Code, Civil Service Code, seat of government |
| **Education & Culture** | 4 | BAA 12, 18, 40, 50, 81 | BSC, Education Code, Science High School, Kulliyyah, Salamat Award |
| **Economy & Labor** | 4 | BAA 9, 19, 59, 72, 82 | Recruitment regulation, overseas workers, agriculture training, bereavement leave, Labor Code |
| **Environment & Development** | 2 | BAA 6, 31 | Development planning system, Sustainable Development Board |
| **Peace & Security** | 3 | BAA 57, 60, 61 | Mujahideen financial assistance, memorial sites |
| **Holidays** | 1 | BAA 39 | BARMM Holidays Code |
| **Miscellaneous** | 4 | BAA 56, 66-69 | Titles not on public record |

## The Six Fundamental Codes

BOL Article XVI, Section 4 mandates the BTA to enact **seven priority codes** during the transition period.[^3] As of March 2026, four have been enacted:

1. **Bangsamoro Administrative Code** (BAA 13, October 2020) — structures the bureaucracy
2. **Bangsamoro Civil Service Code** (BAA 17, February 2021) — merit and fitness system
3. **Bangsamoro Education Code** (BAA 18, May 2021) — integrated education system

4. **Bangsamoro Electoral Code** (BAA 35, 2023) — election rules, amended by BAA 87 and BAA 88

Three priority codes remain unenacted:

1. **Revenue Code** — own-source revenue generation framework
2. **Local Government Code** — though BAA 49 (Bangsamoro Local Governance Code) addresses this substantially
3. **Investment Code** — investment promotion and economic zone framework

Beyond the seven priority codes, Parliament has also enacted the **Bangsamoro Budget System Act** (BAA 84) and the **Bangsamoro Labor and Employment Code** (BAA 82), which function as fundamental codes in their respective domains.[^4]

## What Comes Next

The first parliamentary elections will transform the legislative agenda. Elected Members of Parliament will bring constituency priorities that differ from those of the appointed BTA. The legislative pipeline will shift from foundational institution-building toward **implementation refinement**, **amendment of existing codes**, and **responsive legislation** addressing emerging needs.

This means the codification challenge will intensify. Every new BAA must be integrated into the existing legal corpus. Every amendment must be tracked against the provision it modifies. Every new mandate must be checked for conflicts with existing mandates. Without AI, this work quickly exceeds the capacity of any parliamentary staff team.

---

## 11.2 AI for Codification and Legal Harmonization

### The Problem Codification Solves

Consider what happens when a legislative researcher in the Bangsamoro Parliament needs to answer a seemingly simple question: **What are all the provisions in enacted BAAs that grant powers to the Ministry of Health?**

Without codification, the researcher must read all 89 BAAs. The obvious starting point is BAA 13 (Administrative Code), which defines ministry mandates. But hospital upgrade BAAs (BAA 25-30, 73, 74, 76, 78-80) also grant implementation mandates to MOH. BAA 85 (GAA FY 2026) allocates specific health budgets with spending conditions. BAA 83 (Bangsamoro Nutrition Commission) creates an agency with overlapping health jurisdiction. The researcher might miss any of these cross-references.

**Codification organizes all enacted provisions by subject matter** so that related provisions from different BAAs appear together. **Harmonization identifies and resolves conflicts** between provisions that contradict each other or create ambiguity. AI handles both tasks at scale.

### Cross-Referencing Provisions Across BAAs

The first codification task is **mapping** — building a cross-reference index that connects every provision to every other provision it relates to. This is exactly the kind of pattern-matching work where AI outperforms human effort.

**Sample Prompt — Cross-Reference Mapping:**

```
You are a legal codification specialist for the Bangsamoro Parliament.

I am uploading the full text of [NUMBER] enacted Bangsamoro Autonomy Acts. Build a cross-reference index as follows:

For each BAA, identify every section that: 1. Explicitly amends or repeals a provision in another BAA (cite both the amending and amended provisions) 2. Creates a mandate, power, or function that overlaps with a mandate in another BAA (cite both provisions and describe the overlap) 3. Defines a term that is also defined differently in another BAA (cite both definitions and flag the inconsistency) 4. References another BAA by number or subject matter

Output format: a table with columns: BAA (Source) | Section | BAA (Target) | Section | Relationship Type (amends, repeals, overlaps, defines differently, references)

Sort by BAA number. Flag all definitional inconsistencies as [TERMINOLOGY CONFLICT].
```

## Identifying Conflicts

Not all overlaps are conflicts. BAA 82 (Labor Code) and BAA 13 (Administrative Code) both address employment conditions, but they operate in different domains — one covers the private sector, the other structures government. A **conflict** exists when two provisions impose contradictory requirements on the same actor in the same situation.

**Sample Prompt — Conflict Detection:**

```
From the cross-reference index, extract all entries marked as "overlaps" or "defines differently."

For each entry, assess: 1. Do the two provisions impose contradictory obligations on the same entity? 2. Could a person or office attempting to comply with both provisions face an impossible or ambiguous situation? 3. Does one provision appear to supersede the other (enacted later, more specific, or explicitly intended to prevail)?

Classify each overlap as: - CONFLICT (contradictory obligations, no clear resolution) - AMBIGUITY (unclear which provision controls) - COMPLEMENTARY (overlapping but compatible) - SUPERSEDED (one clearly prevails over the other)

For each CONFLICT or AMBIGUITY, recommend a resolution approach: amendment, IRR clarification, or parliamentary interpretation. ```
```

## Terminology Consistency

One of the most common sources of legal ambiguity is **inconsistent terminology**. The same concept may be called different names in different BAAs enacted years apart. A ministry renamed through reorganization may still carry its old name in earlier enactments. A technical term defined in one code may be used without definition in another.

> **Sample Prompt — Terminology Audit:**
>
> ``` Conduct a terminology audit across all uploaded BAAs.
>
> 1. Extract every defined term from each BAA's "Definition of Terms" section
> 2. Identify terms that appear in multiple BAAs — compare definitions for consistency
> 3. Identify terms used in BAA provisions that are NOT defined in that BAA but ARE defined in another BAA
> 4. Identify instances where different BAAs use different terms for what appears to be the same concept (e.g., "barangay health station" vs. "barangay health center" vs. "community health facility")
> 5. Flag all inconsistencies as [DEFINE], [RECONCILE], or [STANDARDIZE]
>
> Output: a terminology concordance table sorted alphabetically, with each term showing all BAAs where it appears and how it is defined or used. ```

## Building the Bangsamoro Legal Corpus Database

The long-term codification goal is a **searchable legal corpus** — a structured database where every provision is tagged by subject, ministry, date of enactment, amendment history, and related provisions. AI can generate the initial structure.

**Practical steps for building the corpus:**

1. **Digitize all enacted BAAs** in a consistent format (markdown or structured text)
2. **Tag every provision** with metadata: BAA number, section number, subject category, responsible ministry, effective date
3. **Map all amendments** — when BAA 37 amends BAA 13, Section 9, link them bidirectionally
4. **Generate subject-matter clusters** — all provisions related to health, all provisions related to procurement, all provisions related to local government
5. **Build a change log** — when a new BAA amends or repeals an existing provision, the corpus updates automatically

This connects directly to **Chapter 4 (Data, Documents, and Knowledge Management)**, where building BARMM-specific AI knowledge bases is covered in detail.

---

# 11.3 AI for IRR Development

## Why IRRs Matter

An enacted BAA sets the legal framework. The **Implementing Rules and Regulations (IRR)** translate that framework into operational detail. The BAA says what must be done. The IRR specifies how, by whom, within what timeline, using what forms, following what procedures.

Without an IRR, an enacted BAA often remains partially or fully unimplemented. This is not a theoretical problem in BARMM. Chapter 10 documented the compliance tracking challenge: some priority codes have been enacted for years without complete IRRs.[^5] The delay is not always about political will. Drafting an IRR requires deep legal analysis, operational expertise, and interagency coordination — resources that implementing agencies may lack.

AI does not replace the implementing agency's operational knowledge. But it generates the **structural framework** of an IRR from the enacted BAA text, which the agency then fills in with operational specifics.

## Extracting IRR Requirements from Enacted BAAs

Before drafting an IRR, you need to know exactly what the BAA requires.

> **Sample Prompt — IRR Requirement Extraction:**
>
> ``` You are a legal analyst supporting IRR development for the Bangsamoro Government.
>
> I am uploading [BAA NUMBER AND TITLE]. Extract every provision that requires implementing rules, regulations, guidelines, or operational procedures.
>
> For each provision: 1. Section number and title 2. The specific obligation ("shall issue implementing rules," "as may be prescribed by rules," "in accordance with guidelines to be promulgated," etc.) 3. The implementing body (which ministry, office, or commission is responsible) 4. The deadline (if specified in the BAA) 5. The scope — what operational detail the IRR must supply
>
> Also identify provisions that do NOT explicitly require an IRR but that are too general to implement without additional operational guidance. Flag these as [RECOMMENDED IRR PROVISION].
>
> Output: a table sorted by section number. ```

## Drafting IRR Frameworks

Once requirements are extracted, AI can generate an IRR framework — the structural skeleton that the implementing agency completes.

> **Sample Prompt — IRR Framework Draft:**
>
> ``` Draft an IRR framework for [BAA NUMBER AND TITLE].
>
> Structure the IRR as follows: RULE I — Title and Authority RULE II — Definition of Terms (carry over definitions from the BAA; add operational definitions needed for implementation) RULE III — Coverage and Applicability RULE IV onward — One rule per major substantive provision of the BAA that requires operational detail FINAL RULE — Effectivity and Repealing Clause
>
> For each rule: 1. Cite the specific BAA section being implemented 2. State the implementing agency's obligation 3. Identify the operational details the IRR must specify (forms, timelines, procedures, responsible offices) 4. Leave placeholders marked [AGENCY TO SUPPLY] where operational specifics depend on the agency's internal structure and resources
>
> Include a compliance timeline: which rules take effect immediately upon promulgation and which have phased implementation dates.
>
> [Upload the full BAA text] ```

## The IRR Quality Checklist

Use AI to verify that a draft IRR meets quality standards before promulgation.

### Table 11.2: IRR Quality Verification Checklist

| Check | What AI Verifies | What Humans Verify |
|---|---|---|
| **Completeness** | Every BAA provision requiring an IRR has a corresponding rule | Whether the operational detail is sufficient for field implementation |
| **Legal fidelity** | IRR rules do not exceed, contradict, or narrow the authority granted by the BAA | Whether the interpretation of BAA provisions reflects legislative intent |
| **Definitional consistency** | Terms defined in the IRR match the BAA's definitions; no undefined terms | Whether operational definitions align with agency practice |
| **Timeline feasibility** | | |

| Check | What AI Verifies | What Humans Verify |
|---|---|---|
| | Compliance deadlines are internally consistent | Whether the agency can realistically meet the deadlines |
| **Interagency clarity** | Where multiple agencies share implementation responsibility, roles are clearly delineated | Whether the agencies have agreed to the delineation |
| **BOL alignment** | IRR provisions fall within the Bangsamoro Government's powers under BOL Article V, Section 2 | Whether the IRR triggers intergovernmental coordination requirements under BOL Article VI |

**Case Study: Drafting the IRR Framework for BAA 84 (Bangsamoro Budget System Act)**

BAA 84 establishes the Bangsamoro budget system framework, covering the entire budget cycle from preparation through accountability.[^6] The Budget System Act is one of the most operationally complex BAAs in the Bangsamoro corpus because it touches every ministry, every office, and every local government unit within BARMM.

An AI-assisted IRR workflow for BAA 84 would proceed as follows:

**Step 1 — Extract.** Upload the full text of BAA 84. Prompt the AI to extract every provision requiring implementing rules. The extraction should identify provisions on budget preparation calendars, submission formats, allotment release procedures, obligation authority limits, accountability reporting requirements, and the roles of the Ministry of Finance, Budget, and Management (MFBM) in each stage.

**Step 2 — Map dependencies.** BAA 84 does not operate in isolation. It interacts with annual GAAs (BAA 85 for FY 2026), the Administrative Code (BAA 13), and the Civil Service Code (BAA 17) for personnel budgeting. Prompt the AI to identify all cross-references between BAA 84 and other enacted BAAs. Where BAA 84 creates obligations that depend on provisions in other BAAs, the IRR must address the coordination mechanism.

**Step 3 — Draft.** Generate the IRR framework with one rule per major budget cycle stage. Leave operational placeholders for MFBM to supply: specific forms, submission deadlines for the next fiscal year, allotment release schedules, and accountability report templates.

**Step 4 — Verify.** Run the draft IRR through the quality checklist (Table 11.2). Confirm that every BAA 84 provision has a corresponding rule. Check that definitions match. Verify that the IRR does not create obligations beyond what BAA 84 authorizes.

**What the AI cannot do:** Determine whether MFBM has the staff capacity to implement a quarterly budget review cycle or whether a monthly allotment release schedule is operationally feasible. Those judgments require the implementing agency's institutional knowledge.

# 11.4 AI for Resolution Drafting and Parliamentary Operations

## Resolutions vs. Bills

The Bangsamoro Parliament produces two main types of legislative measures: **bills** (which become BAAs when enacted) and **resolutions** (which express the sense of Parliament without the force of law, or which address internal parliamentary matters).[^7] Chapter 7 covered AI for bill drafting. This section addresses the distinct requirements of resolution drafting and the parliamentary operations that surround it.

Resolutions serve several purposes in the Bangsamoro Parliament:

- **Congratulatory resolutions** — recognizing achievements of individuals, organizations, or communities
- **Commendatory resolutions** — commending specific actions or milestones
- **Commemorative resolutions** — marking historical events, holidays, or occasions
- **Policy resolutions** — expressing Parliament's position on a policy issue without enacting binding law
- **Oversight resolutions** — directing committees to investigate or report on specific matters
- **Internal resolutions** — governing parliamentary procedures, committee creation, or rules amendments

## The WHEREAS-RESOLVED Structure

Every resolution follows a standard two-part structure: **preamble clauses** (WHEREAS) that establish the factual and legal basis, followed by **operative clauses** (RESOLVED) that state what Parliament is actually doing.[^8]

AI can generate both components from a brief description of the resolution's purpose.

**Sample Prompt — Resolution Draft:**

```` You are a legislative drafter for the Bangsamoro Parliament.

Draft a [TYPE] resolution for the following purpose: [DESCRIBE THE PURPOSE IN 2-3 SENTENCES]

Structure: 1. TITLE: "A Resolution [verb]-ing [subject]" 2. WHEREAS CLAUSES (preamble): - Clause 1: Legal basis (cite the BOL provision, BAA, or Constitutional provision that gives Parliament authority) - Clause 2: Factual background (what happened or what condition exists) - Clause 3-5: Supporting facts, prior legislative action, or policy context - Each WHEREAS clause should be one sentence - Begin with "WHEREAS," followed by the statement, ending with a semicolon 3. RESOLVED CLAUSES (operative): - "NOW, THEREFORE, BE IT RESOLVED, as it is hereby resolved," followed by the operative provision - If multiple operative clauses: "RESOLVED, FURTHER," - Final clause: effectivity

Use formal legislative language. Cite specific BAA sections and BOL articles where applicable.

[Provide any supporting documents or factual details] ```

## Strengthening WHEREAS Clauses

Weak preamble clauses undermine even well-intentioned resolutions. A WHEREAS clause that says "WHEREAS, the Bangsamoro Parliament recognizes the importance of education" adds nothing. A strong WHEREAS clause cites a specific provision, references specific data, or states a specific fact.

**Sample Prompt — WHEREAS Clause Strengthening:**

```` Review the following draft resolution for the Bangsamoro Parliament. Strengthen each WHEREAS clause by:

1. Adding specific legal citations (BOL article and section, BAA number and section, or national law)
2. Replacing general statements with specific facts, data points, or documented events
3. Ensuring each WHEREAS clause builds logically on the previous one (legal basis → factual background → specific circumstances → justification for action)
4. Removing redundant clauses that repeat the same point in different words

For any factual claim you cannot verify from the uploaded documents, mark it as [VERIFY: source needed].

[Paste the draft resolution] ```

## Parliamentary Operations Support

Beyond individual resolutions, AI assists with the operational machinery of Parliament:

### Table 11.3: Parliamentary Operations with AI Support

| Operation | Manual Process | AI-Assisted Process |
|---|---|---|
| **Order of Business preparation** | Secretary manually compiles agenda items from committee reports and pending measures | AI generates draft order of business from committee status reports, pending bills, and calendar deadlines |
| **Committee referral** | Speaker's office determines appropriate committee(s) based on subject matter | AI recommends primary and secondary committee referrals by matching bill subject against committee jurisdictions |
| **Co-authorship tracking** | Staff manually tracks which MPs have signed onto each measure | AI maintains a co-authorship database and generates reports on sponsorship patterns |
| **Session minutes synthesis** | Staff transcribes and summarizes plenary proceedings | AI converts session recordings or transcripts into structured minutes with speaker attribution |
| **Legislative calendar management** | Manual tracking of filing deadlines, committee report deadlines, and plenary scheduling | AI generates timeline alerts and identifies scheduling conflicts |

# 11.5 AI for Legislative Tracking and Status Reporting

## The Tracking Challenge

At any given time, the Bangsamoro Parliament has dozens of measures at different stages: bills filed but not yet referred, bills in committee, bills reported out for plenary debate, bills pending interpellation, resolutions awaiting adoption. Staff, committee chairs, and Members of Parliament all need to know the status of specific measures — and no one has time to compile the answer manually from scattered records.

AI builds and maintains the **legislative tracking system** that makes status reporting instantaneous.

## Building the Legislative Status Database

The foundation is a structured database that captures every measure and its current status.

> **Sample Prompt — Legislative Status Database Design:**
>
> ``` Design a legislative tracking database structure for the Bangsamoro Parliament.
>
> Fields for each measure: 1. Measure type (bill or resolution) 2. Measure number (e.g., PB-424, PR-47) 3. Short title 4. Principal author(s) 5. Co-author(s) 6. Date filed 7. Committee referral (primary and secondary committees) 8. Date referred to committee 9. Committee action (hearing scheduled, hearing completed, committee report filed, substitute bill proposed) 10. Date of committee report 11. Plenary status (first reading, second reading, interpellation, period of amendments, third reading, enrolled) 12. Date of plenary action 13. For bills: BAA number assigned upon enactment 14. Related measures (companion bills, substitute bills, amendments to existing BAAs)
>
> Include status categories: FILED → REFERRED → IN COMMITTEE → REPORTED OUT → PLENARY (1ST READING → 2ND READING → 3RD READING) → ENROLLED → ENACTED
>
> Generate sample entries using the following real measures: - PB-424 (latest filed bill) - BAA 86 (Parliamentary District Act, enacted January 2026) - BAA 84 (Budget System Act) ```

## Generating Status Reports

Once the database exists, AI generates status reports on demand.

**Sample Prompt — Legislative Pipeline Report:**

```` From the legislative tracking database, generate a status report covering:

1. PIPELINE SUMMARY: Total measures filed, in committee, reported out, enacted — broken down by type (bill vs. resolution)
2. COMMITTEE WORKLOAD: For each standing committee, list the number of measures pending, measures acted on this quarter, and average days from referral to committee report
3. AGING REPORT: List all measures that have been in committee for more than [N] days without action
4. ENACTMENT RATE: Percentage of filed bills that reached enactment, by session period
5. PRIORITY LEGISLATION STATUS: Status of any measures identified as priority by the Chief Minister or the Speaker

Format: executive summary (1 paragraph) followed by detailed tables. Flag all measures older than 180 days in committee as [REVIEW NEEDED]. ```

## Committee Referral Recommendations

When a new bill is filed, it must be referred to the appropriate committee. Some bills clearly belong to a single committee. Others involve multiple policy domains and require referral to a primary committee with secondary referral to other committees.

**Sample Prompt — Committee Referral Analysis:**

```` A new bill has been filed in the Bangsamoro Parliament:

Title: [BILL TITLE] Subject: [BRIEF DESCRIPTION]

Based on the following committee jurisdictions of the Bangsamoro Parliament, recommend: 1. PRIMARY COMMITTEE: The committee with principal jurisdiction over the bill's primary subject matter 2. SECONDARY COMMITTEE(S): Any committees with overlapping jurisdiction that should review specific provisions 3. JUSTIFICATION: For each recommendation, cite the specific provisions of the bill that fall within that committee's jurisdiction

If the bill involves budgetary implications, always include the Committee on Appropriations as a secondary referral.

[Paste the bill title, explanatory note, or full text] [Paste the committee jurisdiction list] ```

## Tracking Amendments to Existing BAAs

Some of the 89 BAAs have already been amended. BAA 3 was amended by BAA 14. BAA 13 was amended by BAA 37. BAA 23 was amended by BAA 33. BAA 32 was amended by BAA 52. BAA 35 was amended by BAA 87 and BAA 88. BAA 54 was amended by BAA 70. BAA 55 was amended by BAA 71. BAA 58 was superseded by BAA 86 after the Supreme Court struck down both BAA 58 and BAA 77.[^9]

Tracking these amendment chains manually is error-prone. AI maintains the amendment history.

> **Sample Prompt — Amendment Chain Tracker:**
>
> ``` From the following list of 89 BAAs, identify every amendment relationship.
>
> For each amendment: 1. Amending BAA (number and title) 2. Amended BAA (number and title) 3. Specific section(s) amended 4. Nature of amendment (modifies text, extends deadline, repeals provision, adds new provision) 5. Whether the amendment is the most recent change to that section (or whether it has been further amended)
>
> Also identify: - BAAs that have been struck down by the Supreme Court (cite the case) - BAAs that repeal provisions of predecessor laws (e.g., MMAA provisions repealed by BAAs)
>
> Output: amendment chain table sorted by original BAA number, showing the full amendment history for each.
>
> [Paste or upload the BAA index with amendment notes] ```

---

# 11.6 Closing the Cycle: How Enacted Legislation Becomes Planning Input

## The Legislation-Planning Loop

The governance cycle in BARMM does not end with enactment. Every enacted BAA creates new conditions that the planning process must account for. The **Bangsamoro Development Plan 2023-2028** identifies six overarching goals and eight cross-cutting strategies.[^10] Each enacted BAA either advances those goals or creates new implementation requirements that the next planning cycle must address.

This feedback loop is the most neglected stage in most governments. Laws are enacted, and the planning agencies continue working from their original assumptions as if nothing changed. AI can close this gap by systematically extracting the planning implications of every new enactment.

## From Enacted BAA to Planning Input

> **Sample Prompt — Legislative Impact on Planning:**
>
> ``` You are a strategic planning analyst for the Bangsamoro Development Authority (BPDA).
>
> I am uploading [BAA NUMBER AND TITLE], recently enacted by the Bangsamoro Parliament. Analyze its implications for the Bangsamoro Development Plan 2023-2028.
>
> For each major provision: 1. Which BDP goal(s) does it advance? (cite the specific goal and strategy) 2. Does it create new implementation obligations that require planning resources (staffing, budget, infrastructure)? 3. Does it change the institutional landscape (new agencies, new mandates, new coordination requirements)? 4. Does it require adjustments to existing plans or targets? 5. Does it create new monitoring indicators that should be added to the BDP results framework?
>
> Output: a planning implications table with columns: BAA Provision | BDP Goal Affected | Planning Implication | Action Required | Responsible Agency
>
> Flag any provision that creates unfunded mandates as [BUDGET IMPLICATION - COORDINATE WITH MFBM]. ```

## Mapping BAAs to BDP Goals

AI can build a comprehensive map connecting all 89 BAAs to their corresponding BDP goals. This map serves multiple purposes: it shows Parliament which development goals have strong legislative support and which have gaps. It shows the planning agencies which laws they must account for. And it provides the evidence base for the next planning cycle.

### Table 11.4: Sample BAA-to-BDP Goal Mapping

| BDP Goal | BAAs That Advance This Goal | Coverage Assessment |
|---|---|---|
| **Goal 1: Just and lasting peace** | BAA 57 (Mujahideen Assistance), BAA 60-61 (Memorials), BAA 62 (IDP Protection), BAA 89 (Transitional Justice) | Moderate — peace financing and transitional justice addressed; community-level reconciliation programs need legislative framework |
| **Goal 2: Moral governance** | BAA 13 (Administrative Code), BAA 17 (Civil Service Code), BAA 84 (Budget System Act) | Strong foundational codes — IRR implementation is the gap |
| **Goal 3: Meaningful self-determination** | BAA 35, 86-88 (Electoral laws), BAA 49 (Local Governance Code), BAA 41-48, 53-55 (New municipalities) | Strong — electoral and local governance framework largely in place |
| **Goal 4: Economic development** | BAA 82 (Labor Code), BAA 9, 19, 59, 72 (Labor/ employment measures) | Revenue Code and Investment Code still needed |
| **Goal 5: Quality social services** | BAA 18 (Education Code), BAA 25-30, 73-74, 76, 78-80 (Health), BAA 40 (Science HS), BAA 83 (Nutrition) | Health infrastructure strong; social protection framework needs expansion |
| **Goal 6: Cultural identity** | BAA 1, 2, 7, 16, 20 (Symbols), BAA 39 (Holidays), BAA 50 (Kulliyyah), BAA 64 (IP Rights) | Cultural symbols established; cultural industry development legislation needed |

## Feeding Oversight Findings Back into Legislation

Chapter 10 traced the **accountability chain** from AI-generated oversight analysis to formal parliamentary action.[^11] The final link in that chain connects back to this chapter: when oversight reveals a gap in existing legislation, the finding becomes the basis for a new bill or amendment.

### The complete governance cycle with AI support:

1. **Plan** (Chapter 5) — BDP sets goals and strategies
2. **Budget** (Chapter 6) — GAA allocates resources to achieve goals
3. **Legislate** (Chapter 7) — Parliament enacts BAAs creating the legal framework
4. **Implement** (Chapter 8) — Ministries execute through IRRs and programs
5. **Monitor** (Chapter 9) — M&E tracks progress against targets
6. **Oversee** (Chapter 10) — Parliament holds the executive accountable
7. **Codify** (Chapter 11) — Enacted legislation is organized, harmonized, and fed back into planning

AI supports every stage. The output of each stage becomes the input for the next. The Bangsamoro legal corpus is not a static archive — it is a living system that grows, adapts, and informs the continuous cycle of governance.

## Cross-References to Other Chapters

| Topic | Where to Go |
|---|---|
| Building the BARMM legal knowledge base | Chapter 4, Section 4.3 |
| AI for strategic planning with BDP alignment | Chapter 5, Section 5.2 |
| Budget legislation and GAA analysis | Chapter 6, Sections 6.2-6.4 |
| AI for bill drafting (detailed process) | Chapter 7, Sections 7.2-7.5 |
| Oversight findings that trigger new legislation | Chapter 10, Section 10.6 |
| Ethics of AI in legal codification | Chapter 12, Section 12.3 |
| Prompt library for codification tasks | Appendix A, Section A.6 |

## Summary

The Bangsamoro Parliament's 89 BAAs are a legislative achievement. Transforming them into a coherent, searchable, internally consistent legal system is the next institutional challenge. Codification, harmonization, IRR development, parliamentary operations management, legislative tracking, and the legislation-planning feedback loop — these are the tasks that determine whether enacted laws translate into functioning institutions.

AI does not codify. It does not harmonize conflicting provisions based on policy intent. It does not decide which IRR interpretation best serves legislative purpose. It does not exercise the Speaker's judgment on committee referrals. Those are human functions.

But AI identifies every cross-reference across 89 BAAs in minutes. It flags every terminology inconsistency. It generates IRR frameworks that agencies can refine rather than build from nothing. It tracks amendment chains that no staff member can hold in memory. It builds the legislative tracking system that makes pipeline management instantaneous. And it maps enacted legislation back to development goals so the planning cycle stays current.

The practical workflow follows the same pattern as every chapter in this guidebook:

1. **Prepare the corpus** — digitize and tag all enacted BAAs, resolutions, and IRRs
2. **Prompt precisely** — use the structured prompts in this chapter, adapted to your specific codification or tracking task
3. **Verify against enacted text** — AI-generated cross-references, conflict flags, and IRR frameworks must be checked against the actual provisions
4. **Connect to action** — every codification finding should lead to a concrete outcome: an amendment proposal, an IRR deadline, a planning adjustment, or a harmonization recommendation

The final chapters of this guidebook address the ethical framework (Chapter 12), the implementation roadmap (Chapter 13), training and capacity building (Chapter 14), and the long-term vision for AI-augmented governance in BARMM (Chapter 15).

## Footnotes

[^1]: The Bangsamoro Transition Authority Parliament has enacted BAA 1 through BAA 89 as of January 2026. See the BAA Quick-Reference Index for the complete categorized list.

[^2]: The 13 domain categories are derived from the BAA Quick-Reference Index: Governance & Administration, Budget & Appropriations, Health, Education & Culture, Economy & Labor, Environment & Development, Social Welfare & Human Rights, Electoral, Local Government, Symbols & Identity, Peace & Security, Holidays, and Miscellaneous.

[^3]: Republic Act No. 11054 (Bangsamoro Organic Law), Art. XVI, Sec. 4. The BOL mandates the BTA to enact priority codes including the Administrative Code, Revenue Code, Electoral Code, Local Government Code, Civil Service Code, Education Code, and Investment Code during the transition period.

[^4]: BAA 84 (Bangsamoro Budget System Act of 2025) establishes the comprehensive budget cycle framework for the Bangsamoro Government. BAA 82 (Bangsamoro Labor and Employment Code) provides the labor and employment regulatory framework for BARMM.

[^5]: See Chapter 10, Section 10.4 (Compliance Monitoring Across BAAs) and the case study on tracking IRR compliance across priority codes.

[^6]: BAA 84 (Bangsamoro Budget System Act of 2025). The Budget System Act covers budget preparation, authorization, execution, and accountability for the Bangsamoro Government.

[^7]: Saidamen R. Mambayao, *Bill Drafting Guidebook for the Bangsamoro Parliament: A Practical Guide for Members of Parliament, Parliamentary and Legislative Staff, Bill Drafters, and Consultants* (2026), Chapters 2 and 5. The Bill Drafting Guidebook distinguishes between bills (which become BAAs) and resolutions (which express the sense of Parliament).

[^8]: The WHEREAS-RESOLVED structure follows standard parliamentary drafting convention. WHEREAS clauses establish the preamble (factual and legal basis); RESOLVED clauses state the operative provisions. See the *Bill Drafting Guidebook*, Chapter 5, for the complete resolution drafting framework.

[^9]: Amendment chain as of March 2026: BAA 14 amends BAA 3 (extends FY 2020 appropriations). BAA 37 amends BAA 13 (seat of government). BAA 33 amends BAA 23 (extends FY 2022 GAA). BAA 52 amends BAA 32 (extends FY 2023 GAA). BAA 87 and BAA 88 amend BAA 35 (Electoral Code). BAA 70 amends BAA 54 (Municipality of Datu Sinsuat Balabaran). BAA 71 amends BAA 55 (Municipality of Sheik Abas Hamza). BAA 77 and BAA 58 were declared unconstitutional by the Supreme Court in *Ali et al. v. BTA* (G.R. No. E-02219) and *Macapaar et al. v. COMELEC* (G.R. No. E-02235), decided September 30, 2025. BAA 86 (Parliamentary District Act) was enacted in January 2026 as the replacement.

[^10]: Bangsamoro Development Plan 2023-2028, Chapter 4. The BDP identifies six overarching development goals: (1) Just and lasting peace, (2) Moral governance, (3) Meaningful self-determination, (4) Economic development and poverty reduction, (5) Quality social services, (6) Cultural identity and diversity. Eight cross-cutting strategies support these goals.

[^11]: See Chapter 10, Section 10.6 (The Accountability Chain: From AI Analysis to Formal Action). The six-link accountability chain traces the path from AI-generated detection through verification, preparation, committee action, follow-up, and formal recommendation.

# 12

# Ethics, Islamic Values, and Responsible AI

Every tool is morally neutral until a human picks it up. A spreadsheet can track disaster relief distributions or hide stolen funds. A policy brief can clarify public debate or manipulate it. A budget proposal can allocate resources justly or divert them to political allies. The tool does not decide. You do.

AI is no different. It can draft legislation that serves the public interest or generate plausible-sounding text that obscures accountability. It can analyze budget data to reveal inequities or produce analyses that confirm whatever conclusion you wanted. It can accelerate government services to underserved communities or widen the gap between connected insiders and everyone else.

The Bangsamoro Autonomous Region in Muslim Mindanao has something that most AI governance frameworks worldwide lack: **a moral foundation that predates the technology.** The Twelve Pillars of Moral Governance, the Islamic principles embedded in the Bangsamoro Organic Law, and the Enhanced 12-Point Priority Agenda provide an ethical infrastructure that is not borrowed from Silicon Valley or imported from a UN working paper. It grows from the identity and values of the Bangsamoro people themselves.[^1]

This chapter connects that moral foundation to the practical reality of AI use in government. It does not offer abstract philosophy. It gives you specific principles, clear boundaries, and a Bangsamoro-grounded framework for deciding when AI serves public interest — and when it does not.

---

## 12.1 Moral Governance and AI

The BARMM government anchors its operations in Moral Governance — a leadership framework built on twelve pillars that guide all public servants in the Bangsamoro region.[^2] These pillars are not aspirational slogans. They are operational expectations. Every ministry, office, and agency is expected to reflect them in daily decisions.

When you introduce AI into government work, you do not suspend these pillars. You extend them to cover a new tool. The question is not whether AI aligns with Moral Governance. The question is **how you use AI** so that it aligns.

### 12.1.1 The 12 Pillars Applied to AI Adoption

Each pillar creates specific obligations for anyone using AI in government work. Table 12.1 maps all twelve to concrete AI governance applications.

### Table 12.1: The 12 Pillars of Moral Governance Applied to AI

| # | Pillar | Core Principle | AI Governance Application |
|---|---|---|---|
| 1 | **Integrity** | Public office holders must not bind themselves in any manner that could influence their duties | Do not use AI tools that require surrendering government data to private companies without data protection agreements. Do not allow vendor lock-in that compromises independent judgment. |
| 2 | **Accountability** | Public office holders must be open and transparent; must answer to authority | Every AI-assisted document must identify that AI was used in its preparation. The signing official takes full responsibility for the output. Never attribute a decision to "the AI said so." |
| 3 | **Transparency and Honesty** | Declare private interests; make all public transactions public | Disclose AI assistance in policy recommendations, legislative briefers, and budget analyses. If a ministry uses AI to draft a bill, the committee reviewing it has a right to know. |
| 4 | **Sense of Patriotism** | Invest in the Bangsamoro way of life and heritage | Use AI to strengthen — not replace — Bangsamoro cultural knowledge. Train AI with local context and Bangsamoro source materials, not |

| # | Pillar | Core Principle | AI Governance Application |
|---|---|---|---|
| | | | generic global templates. |
| 5 | **Striving for Excellence** | Deliver the highest quality, prioritizing process over results | AI enables faster output. Do not use speed as an excuse to skip review, verification, and quality assurance. A fast but inaccurate briefer is worse than a slow but correct one. |
| 6 | **Cultural Understanding and Tolerance** | Appreciate socioeconomic differences and provincial diversity | Test AI outputs for cultural bias. Check whether AI-generated policy language accounts for differences between mainland and island provinces, between Islamized and non-Moro indigenous communities, and between urban and rural populations. |
| 7 | **Unwavering Loyalty to God** | Public officials are guided by devotion to God | AI is a tool, not an authority. It does not issue fatwas, interpret divine commands, or replace the moral compass that faith provides. Use it within the boundaries of your faith, not as a substitute for it. |
| 8 | **Justice** | Serve without prejudice; equity triumphs over personal allegiance | Audit AI outputs for discriminatory patterns. If an AI-assisted analysis systematically |

| # | Pillar | Core Principle | AI Governance Application |
|---|---|---|---|
| | | | disadvantages a particular province, ethnic group, or gender, reject it. Justice requires that AI serves everyone equitably. |
| 9 | **Inclusivity** | Foster environments free from discrimination | Ensure AI adoption does not create a two-tier bureaucracy where tech-literate staff advance while others are left behind. Design training that reaches all staff, including those in island and remote provinces. |
| 10 | **Objectivity** | Make only merit-based decisions in the public interest | Use AI to reduce bias in analysis, not introduce it. When AI summarizes stakeholder input, verify that it represents all voices — not just the loudest or most digitally accessible ones. |
| 11 | **Dialogue and Meaningful Engagement** | Seek community opinion through dialogue | Consult staff, communities, and stakeholders before deploying AI in services that affect them. Do not automate processes that communities expect to involve human interaction without first discussing the change. |

| # | Pillar | Core Principle | AI Governance Application |
|---|---|---|---|
| 12 | **Balance Between Practical Life and Moral Side** | Balance practical duties with moral/ ethical values | AI maximizes efficiency. But efficiency without ethics produces harm. Before automating any process, ask: does this serve the community's well-being, or just our workload? |

The table is not decorative. **Print it.** Post it in your office. When you are about to use AI for a government task, scan the twelve pillars and ask yourself: does this use honor every one? If any pillar is compromised, stop and redesign the approach.

### 12.1.2 Transparency and Honesty in AI-Assisted Outputs

Pillar 3 — Transparency and Honesty — deserves its own section because it is the pillar most frequently violated in AI-assisted government work. The violation is rarely deliberate. It happens by omission.

**The pattern works like this.** A policy analyst uses AI to draft a legislative briefer. The briefer is well-structured, properly cited, and convincingly written. The analyst submits it to the committee chairperson. The chairperson reads it, approves it, and presents its findings in a committee hearing. At no point does anyone disclose that AI assisted in the drafting. The committee members, the ministry officials responding to the briefer's findings, and the public watching the hearing all assume the analysis is entirely the product of the parliamentary staff's expertise.

Is the briefer wrong? Not necessarily. But is the process honest? No.

**The Transparency Rule for AI-Assisted Government Outputs:**

1. **Label AI-assisted documents.** Include a note — "This document was prepared with AI assistance. All content has been reviewed and verified by [name and designation]." Place it in the document header or at the end, before the signature block.
2. **Identify what AI contributed.** Was it the initial draft? The research synthesis? The data analysis? The formatting? Be specific.

3. **Confirm human verification.** State who reviewed the AI output, what verification steps were taken, and what sources were checked.
4. **Do not present AI speed as human productivity.** If your team produced a 30-page analysis in two days that would normally take two weeks, acknowledge that AI was part of the process. Claiming the output as purely manual work misrepresents your team's capacity and sets unrealistic expectations for future work.

This transparency rule applies to all outputs covered in this guidebook: legislative briefers (Chapter 7), budget analyses (Chapter 6), M&E reports (Chapter 9), oversight analyses (Chapter 10), and policy recommendations.

---

## 12.2 Islamic Principles for AI Use

The Bangsamoro Organic Law recognizes Islamic values as integral to governance in the region.[^3] Article X establishes Shari'ah jurisdiction, with the Qur'an and Sunnah as its principal sources.[^4] Article IX, Section 24 mandates the preservation and promotion of Bangsamoro culture and identity.[^5] The Wali serves as the ceremonial head representing the moral authority of the Bangsamoro people.[^6]

These provisions are not ceremonial. They establish that governance in BARMM operates within an Islamic moral framework. When a new tool enters that framework, it must be evaluated against the principles that govern it.

Four Islamic principles are directly relevant to AI adoption in government. Each creates a specific obligation.

### 12.2.1 Amanah — Trustworthiness

**Amanah** means trust — the trust placed in you by God, by your institution, and by the people you serve. In the supervision guidebook, amanah is defined as the ethical foundation of the supervisory role: "You hold a trust. Your staff trust you to be fair. Your superiors trust you to deliver results. The public trusts you to use resources wisely."[^7]

Applied to AI, amanah creates three obligations:

**First, protect data entrusted to you.** When you upload government documents to an AI tool, you transfer information that the public entrusted to your office. Ask: Does this AI tool store the data? Who has access? Is the data processed on servers outside the Philippines? If a citizen's personal information appears in the document, does the AI tool comply with the Data Privacy Act of 2012 (Republic Act No. 10173)?[^8]

**Practical test:** Before uploading any document to an AI tool, answer these questions:

- Does the document contain personally identifiable information?
- Does the document contain classified or restricted information?
- Does the AI tool's privacy policy allow data retention and model training on uploaded content?
- Would you be comfortable if this document appeared publicly because of a data breach at the AI provider?

If any answer gives you pause, do not upload the document. Use the AI tool with sanitized or anonymized content instead.

**Second, verify before you submit.** Amanah requires that what you present is truthful. AI generates plausible text — but plausible is not the same as accurate. If you submit an AI-drafted briefer containing a fabricated BAA number, an incorrect provision reference, or an invented statistic, you have breached amanah. The AI did not lie. **You failed to verify.**

**Third, do not overstate AI's contribution as your own — or understate it.** Both directions violate amanah. Claiming AI work as purely your own is dishonest. Dismissing your own analytical judgment as "just AI" understates the human expertise that shaped the prompt, selected the sources, and verified the output. Accurate representation is the standard.

> "Every one of you is a shepherd, and every one of you will be asked about his flock." — Hadith (Bukhari and Muslim)[^9]

The hadith applies directly. The document you sign is part of your flock. The data you handle is part of your flock. The AI tool you select and the outputs you submit — all of it is your responsibility.

### 12.2.2 Adl — Justice

**Adl** means justice and fairness. In Islamic governance, justice is not optional — it is obligatory. The Qur'an commands: "O you who have believed, be persistently standing firm in justice, witnesses for Allah, even if it be against yourselves or parents and relatives" (An-Nisa 4:135).[^10]

Applied to AI, adl requires you to ask: **Does this AI application treat everyone fairly?**

**Bias in AI is real.** Large language models are trained on internet text. That text reflects the biases of its authors — and most of that text was written in English by people in North America, Europe, and East Asia. When you use AI to analyze data about BARMM communities, the AI has almost no training data about Maguindanaon governance traditions, Tausug maritime culture, or Teduray highland communities.[^11] It will default to generalizations. Those generalizations may be wrong, and they may systematically disadvantage communities that are already underrepresented.

**Justice requires active checking.** Do not assume AI output is neutral. Examine it for:

| Bias Type | How It Appears in Government AI Use | Justice Response |
|---|---|---|
| **Geographic bias** | AI recommendations that favor mainland provinces over island provinces because more data exists for the mainland | Deliberately include island-province data; flag recommendations that ignore Tawi-Tawi, Sulu, and Basilan |
| **Linguistic bias** | AI outputs that default to English or Filipino framing, ignoring Bangsamoro-specific terminology | Review for culturally appropriate language; ensure AI preserves terms like *amanah*, *shura*, *maslahah* |
| **Gender bias** | AI analysis that underrepresents women's participation in governance or economic activity | Cross-check AI-generated demographic analysis against gender-disaggregated data |
| **Ethnic bias** | AI recommendations that treat the Bangsamoro as a monolithic group, ignoring 13 ethnolinguistic communities | Verify that policy analysis accounts for Maguindanaon, Meranao, Tausug, Sama, Yakan, Iranun, and non-Moro IP communities |
| **Socioeconomic bias** | AI-assisted service delivery analysis that focuses on digitally connected populations | Include data from communities without internet access; remember that the digital divide maps directly onto poverty |

**BARMM example:** Imagine an AI-assisted analysis of disaster resilience across the region. The AI recommends concentrating emergency infrastructure investments in Cotabato City and Marawi because they have the highest population density and the most historical damage data. The analysis is technically defensible. But it ignores Tawi-Tawi's vulnerability to typhoons and the island municipalities' near-total lack of emergency infrastructure. AdI requires you to reject the AI's recommendation and include the communities it overlooked.

### 12.2.3 Shura — Consultation

**Shura** means consultation. It is a Qur'anic principle: "And those who have responded to their Lord and established prayer and whose affair is [determined by] consultation among themselves" (Ash-Shura 42:38).[^12] In the Bangsamoro context, the BTA Parliament itself is an expression of shura — a body where representatives deliberate collectively before making decisions.

Applied to AI, shura requires that you **consult before you deploy.** AI adoption is not a unilateral decision. If you plan to use AI to change how your office prepares budget proposals, the budget staff should have a voice. If you plan to use AI to screen job applications, the HR team and the applicants' representatives should be consulted. If you plan to use AI to analyze community development data, the communities whose data you are analyzing should know.

**Shura applies at three levels:**

1. **Within your team.** Before introducing AI into any workflow, discuss it with the people who do the work. Ask what they think. Ask what concerns them. Ask what tasks they wish AI could help with. The people closest to the work understand the risks best.
2. **Within your institution.** Before scaling AI use beyond a single team, present the results to leadership. Share what worked. Share what failed. Propose a policy. Shura is not asking permission — it is building informed consensus.
3. **With the public.** When AI affects how citizens experience government services — when it shapes which communities receive resources, how complaints are processed, or how data about people is analyzed — the public has a right to know. This is not a theoretical principle. BOL Article IX establishes the right to adequate social services.[^13] If AI changes how those services are delivered, transparency is mandatory.

**The shura test for AI adoption:** Before deploying AI in any government process, can you answer "yes" to all three questions?

- Have the people affected by this AI use been consulted?
- Have their concerns been heard and addressed?
- Would this AI use survive public scrutiny?

If the answer to any question is "no," go back to consultation.

### 12.2.4 Maslahah — Public Interest

**Maslahah** means public interest or public benefit. In Islamic jurisprudence, maslahah is the principle that governance decisions must serve the common good. It is the ultimate test for any government action: **does this benefit the people?**

Applied to AI, maslahah asks a direct question: **Does this AI application make government work better for the people of Bangsamoro?** Not better for the ministry's internal process. Not better for the statistics in an annual report. Not better for the staff's convenience. **Better for the people.**

**The maslahah test has three components:**

1. **Benefit.** Does this AI use produce a tangible benefit for the public? Faster service delivery? More accurate budget analysis? Better-informed legislation? If the benefit is purely internal efficiency with no public-facing improvement, reconsider.
2. **Harm avoidance.** Does this AI use create risks for any community? Could it lead to biased resource allocation? Could it expose personal data? Could it reduce human contact in services where human judgment is essential? Maslahah requires that you prevent harm before pursuing benefit.
3. **Proportionality.** Is the benefit proportional to the cost and risk? If deploying an AI tool requires a significant technology investment but serves only one office's convenience, maslahah may not be satisfied. If the same investment improves service delivery across five provinces, the calculus changes.

**BARMM application:** A ministry proposes using AI to automate the processing of social welfare applications. The maslahah analysis looks like this:

- **Benefit:** Processing time drops from 30 days to 7 days. More families receive assistance faster. Maslahah is served.
- **Harm risk:** The AI screening algorithm may reject applications from families who lack documentation — precisely the most vulnerable families. Maslahah is violated.
- **Resolution:** Use AI to accelerate processing but keep human reviewers for rejected applications. Require that every denial receives a manual second review within 48 hours. Maslahah is restored.

**Table 12.2: Islamic Principles as AI Guardrails**

| Principle | Arabic | Core Requirement | AI Guardrail | Violation Example |
|---|---|---|---|---|
| **Amanah** | Trust | | | Uploading confidential |

| Principle | Arabic | Core Requirement | AI Guardrail | Violation Example |
|---|---|---|---|---|
| | | Protect what is entrusted to you | Protect data; verify outputs; disclose AI use | documents to an unsecured AI tool |
| **Adl** | Justice | Treat all people fairly | Audit AI outputs for bias against any community | AI-generated budget analysis that consistently underfunds island provinces |
| **Shura** | Consultation | Consult before deciding | Involve affected parties before deploying AI | Implementing AI-based service screening without consulting the communities being screened |
| **Maslahah** | Public Interest | Serve the common good | Evaluate every AI use against public benefit | Using AI to optimize internal workflows while citizens still wait months for services |

## 12.3 The Enhanced 12-Point Priority Agenda and AI Alignment

The BARMM government operates under an Enhanced 12-Point Priority Agenda that defines the transition period's strategic direction.[^14] Each priority area creates opportunities for AI — and each one also creates risks if AI is used without ethical guardrails.

Table 12.3 maps all twelve priorities to AI alignment opportunities and the ethical boundaries that apply.

### Table 12.3: 12-Point Priority Agenda with AI Alignment

| # | Priority Agenda | AI Alignment Opportunity | Ethical Boundary |
|---|---|---|---|
| 1 | **Bureaucracy** — Strengthen the regional bureaucracy | AI-assisted organizational analysis, staffing pattern optimization, workload distribution | Do not use AI to replace positions that serve vulnerable communities. Efficiency gains must translate to better service, not smaller workforce. |
| 2 | **Priority Codes** — Enact seven priority codes | AI-assisted legislative drafting, cross-referencing, and legal harmonization (Chapter 7) | All AI-drafted provisions must be verified against the BOL and existing BAAs by human legal staff. Never submit AI-drafted legislation without expert review. |
| 3 | **Revenue Generation** — Increase revenue and economic advantages | AI-assisted revenue analysis, tax collection pattern identification, fiscal forecasting | Tax analysis must not disproportionately target small businesses in one province while overlooking compliance gaps |

| # | Priority Agenda | AI Alignment Opportunity | Ethical Boundary |
|---|---|---|---|
| | | | elsewhere. Adl applies. |
| 4 | **Social Services** — Improve education, health, social welfare | AI-assisted service delivery analysis, resource allocation modeling, beneficiary targeting | AI must not become a gatekeeper that denies services. Keep human decision-makers in all denial decisions. Maslahah requires this. |
| 5 | **Infrastructure** — Develop strategic infrastructure | AI-assisted project prioritization, procurement documentation, progress monitoring | Infrastructure prioritization must include island and remote provinces, not just areas with the most available data. |
| 6 | **Economic Development** — Foster inclusive economic growth | AI-assisted MSME analysis, cooperative development planning, economic zone modeling | "Inclusive" means all 13 ethnolinguistic groups.[^15] Check whether AI-generated economic strategies account for Teduray, Lambangian, Dulangan Manobo, and B'laan communities alongside Maguindanaon, Meranao, and Tausug populations. |
| 7 | **Environment** — Protect natural resources | AI-assisted environmental monitoring, satellite data analysis, compliance tracking | Environmental analysis must incorporate indigenous knowledge. Non-Moro IP communities have stewardship traditions that predate modern |

| # | Priority Agenda | AI Alignment Opportunity | Ethical Boundary |
|---|---|---|---|
| | | | environmental science. |
| 8 | **Disaster Resilience** — Build community resilience | AI-assisted risk mapping, early warning analysis, post-disaster resource coordination | Disaster response algorithms must prioritize vulnerability, not connectivity. Communities without internet access are often the most at risk. |
| 9 | **Peace and Normalization** — Implement peace agreement provisions | AI-assisted tracking of normalization commitments, decommissioning progress analysis | Peace process data is inherently sensitive. Do not upload decommissioning records, combatant lists, or transitional justice documents to any external AI tool. |
| 10 | **Marawi Rehabilitation** — Support Marawi City recovery | AI-assisted rehabilitation planning, land title analysis, displacement tracking | Marawi data involves displaced families, contested land, and deep trauma. Handle with maximum sensitivity. Human review for every output. |
| 11 | **Peace and Security** — Sustain peace, justice, and security | AI-assisted security pattern analysis, conflict early warning | Security data must never be processed through commercial AI tools. Classify it and keep it within government-controlled systems. |
| 12 | **Cultural Heritage** — Preserve Bangsamoro culture and identity | AI-assisted cultural documentation, tarsila (genealogy) digitization, heritage mapping | Cultural heritage belongs to the communities. Do not digitize cultural materials without |

| # | Priority Agenda | AI Alignment Opportunity | Ethical Boundary |
|---|---|---|---|
| | | | community consent. Do not train AI models on cultural content without permission. |

The table reveals a consistent pattern. **Every priority agenda item benefits from AI assistance — and every one requires human judgment to prevent AI from violating the very values the agenda is meant to serve.** There is no priority area where AI can operate without guardrails.

---

## 12.4 Risks and Safeguards

AI adoption in BARMM governance creates five categories of risk. Each one is real, each one is already present in some form, and each one requires specific safeguards.

### Risk 1: Bias

**What it is.** AI systems reflect the biases in their training data. Large language models are trained predominantly on English-language internet text written by people in the Global North. This means AI has limited understanding of Bangsamoro governance, culture, and context. When it generates analysis about BARMM, it fills gaps with generalizations that may be wrong.

**How it appears.** An AI-generated policy analysis recommends governance reforms based on best practices from countries with established democracies. The recommendations ignore that BARMM is in a transition period, operates under a parliamentary system within a presidential framework, and has a unique intergovernmental relationship with the national government through the BOL.[^16] The recommendations sound sophisticated but are irrelevant.

**Safeguard.** Always provide BARMM-specific context in your prompts. Supply the relevant BAA text, BDP chapter, or institutional data. Do not rely on the AI's general knowledge of Philippine governance — it is incomplete. Review every output for assumptions that do not match BARMM reality.

### Risk 2: Data Sovereignty

**What it is.** When you upload government documents to a commercial AI tool, the data leaves your control. Most AI providers process data on servers outside the Philippines. Some retain uploaded data for model training. This creates a sovereignty risk: government data about Bangsamoro citizens, budgets, and operations may be stored on foreign servers with no guarantee of privacy.

**How it appears.** A ministry uploads five years of provincial budget data to an AI tool for analysis. The AI provider's terms of service allow data retention for "service improvement." The budget data — including granular allocations by municipality — now sits on servers outside the Philippines, accessible to an unknown number of the provider's employees.

**Safeguard.** Establish a data classification system. Define which documents can be uploaded to external AI tools and which must stay within government-controlled systems. As a baseline:

- **Public documents** (published BAAs, resolutions, public reports): May be uploaded.
- **Internal working documents** (draft policies, internal memos, staff records): Upload only with anonymization.
- **Confidential documents** (security data, personnel records with PII, financial audit details): Do not upload to external AI tools under any circumstances.

## Risk 3: Over-Dependency

**What it is.** When AI produces good outputs consistently, staff may stop developing the skills that make those outputs possible. If the AI drafts every briefer, staff may lose the ability to draft one from scratch. If the AI summarizes every audit report, staff may lose the ability to read one critically.

**How it appears.** A new legislative analyst joins the team. She learns to use AI from Day 1. Two years later, the AI tool's subscription lapses. She cannot draft a legislative briefer without it — because she never learned the underlying analytical process. The tool replaced the skill instead of augmenting it.

**Safeguard.** Use the **"apprentice model"** described in the Supervision Guidebook. AI is the journeyman assistant, not the master. Staff must learn the craft first and use AI to amplify what they know.[^17] Periodically require manual work to ensure skills remain sharp. Include "AI-off" exercises in training programs.

## Risk 4: Digital Divide

**What it is.** AI tools require internet access, modern devices, and digital literacy. Not all BARMM staff have all three. Island provinces face connectivity challenges.[^18] Older staff may have limited experience with digital tools. Staff in remote field offices may lack the hardware to run AI applications.

**How it appears.** A ministry's central office in Cotabato City adopts AI tools and sees productivity improve dramatically. The provincial offices in Tawi-Tawi and Basilan do not have reliable internet. A two-tier bureaucracy emerges: fast, AI-augmented decision-making in the center; slow, manual processing in the periphery. The periphery — which serves the most underserved communities — falls further behind.

**Safeguard.** Design AI adoption with the periphery in mind. If AI tools require internet connectivity, pair them with offline alternatives. If training is available only in the central office, create recorded sessions for field staff. Track AI adoption rates by geographic location and address gaps proactively. The 12-Point Priority Agenda's commitment to inclusivity (agenda item 12) demands this.

## Risk 5: Inequality

**What it is.** AI adoption may create power asymmetries within government. Offices that adopt AI early gain advantages in document production, analysis speed, and institutional knowledge management. Offices that do not adopt AI fall behind. Over time, this creates a competitive imbalance that concentrates capability — and influence — in a few units.

**How it appears.** The Office of the Chief Minister's policy staff uses AI extensively. They produce comprehensive analyses faster than any ministry. Over time, ministries begin to defer to OCM analysis rather than developing their own. Institutional capacity concentrates at the top while ministries — the entities closest to service delivery — weaken.

**Safeguard.** Distribute AI training and resources equitably. Ensure that every ministry, not just central offices, has access to AI tools and the skills to use them. The Chapter 13 implementation roadmap addresses this through a phased adoption plan that prioritizes breadth over depth.

---

## 12.5 A Bangsamoro AI Ethics Framework

No existing AI ethics framework was designed for BARMM. Global frameworks from the EU, UNESCO, and OECD address AI governance in general terms but do not account for the Islamic governance tradition, the BOL's unique federal-asymmetric structure, or the specific challenges of a region in political transition.[^19]

BARMM needs its own framework. What follows is a proposed set of principles — grounded in the moral foundations already discussed in this chapter — that can guide AI adoption across the Bangsamoro government.

### The Seven Principles of Bangsamoro AI Ethics

#### Principle 1: Human Authority Over AI (Khalifah)

AI advises. Humans decide. No AI output replaces the judgment of an accountable public servant. The concept of *khalifah* (stewardship/vicegerency) in Islam means that humans are entrusted with authority on earth. AI is a tool within that trust — not a co-decision-maker.

**Practical application:** Every AI-assisted government process must have a designated human decision-maker whose name and designation appear on the final output.

#### Principle 2: Truthfulness in AI-Assisted Outputs (Sidq)

All AI-assisted documents must be verified for accuracy before submission. Sidq (truthfulness) is a non-negotiable Islamic value. Presenting AI-generated content as verified fact without actually verifying it violates sidq.

**Practical application:** Implement the verification protocol from Chapter 3. Check every citation, every data point, every attributed quote. If the AI output contains information you cannot verify, remove it or flag it as unverified.

#### Principle 3: Justice in AI Application (Adl)

AI must serve all communities equitably. No AI application should systematically advantage one ethnic group, province, gender, or socioeconomic class over another. If bias is detected, the AI application must be corrected or withdrawn.

**Practical application:** After any AI-assisted analysis that involves resource allocation, service delivery, or policy targeting, conduct a bias check. Ask: Which communities are included in this analysis? Which are missing? Would a Teduray community in the Maguindanao highlands experience this policy recommendation the same way a Meranao community in Marawi City would?

### Principle 4: Protection of Trust (Amanah)

Government data is a public trust. It must be protected with the same diligence that applies to public funds. Data classification, access controls, and privacy protections apply to all AI-processed government information.

**Practical application:** Classify all government documents before processing them with AI tools. Maintain an AI usage log that records what documents were processed, which AI tool was used, and who authorized the processing.

### Principle 5: Consultation Before Deployment (Shura)

No AI system should be deployed in a government process without consulting the people affected. This applies to government staff whose workflows will change, to communities whose data will be analyzed, and to Parliament when AI affects how laws are implemented.

**Practical application:** Before any ministry adopts AI for a new process, convene a consultation meeting with the relevant division staff. Document the consultation. Record concerns and how they were addressed.

### Principle 6: Public Benefit as the Standard (Maslahah)

Every AI application in BARMM governance must demonstrate a public benefit. Internal efficiency that does not translate to better public service does not satisfy this principle. The benefit must be measurable and must reach the communities the government serves.

**Practical application:** For each AI adoption proposal, require a one-page maslahah assessment: What is the public benefit? Who benefits? Who might be harmed? How will harm be prevented? This assessment accompanies the adoption decision.

### Principle 7: Transparency and Accountability (Hisab)

Hisab means accountability — the awareness that all actions will be accounted for. In AI governance, this means full transparency about how AI is used, what decisions it informs, and who is responsible for the outcomes.

**Practical application:** Publish an annual AI transparency report for each ministry or office that uses AI tools. The report lists: which AI tools are used, for what purposes, how many documents were AI-assisted, what safeguards are in place, and what issues were identified and corrected.

## Summary Table: The Seven Principles

| # | Principle | Arabic Root | One-Sentence Rule |
|---|---|---|---|
| 1 | Human Authority | Khalifah | AI advises; humans decide and sign. |
| 2 | Truthfulness | Sidq | Verify every AI output before submission. |
| 3 | Justice | Adl | Check every AI output for bias against any community. |
| 4 | Protection of Trust | Amanah | Classify data and protect it before AI processes it. |
| 5 | Consultation | Shura | Consult affected people before deploying AI. |
| 6 | Public Benefit | Maslahah | Every AI use must serve the public, not just the office. |
| 7 | Accountability | Hisab | Log, disclose, and report all government AI use. |

## 12.6 When AI Must Not Decide

Throughout this guidebook, the principle has been consistent: **AI prepares; humans decide.** But some decisions carry such weight — moral, legal, cultural, or political — that AI should not even prepare the ground without extraordinary caution. In some cases, AI must be excluded entirely.

This section draws a clear boundary.

### Category 1: Shari'ah Rulings

**AI must never issue, simulate, or recommend Shari'ah rulings.** The Bangsamoro justice system includes Shari'ah courts with jurisdiction over personal law — marriage, divorce, inheritance, custody — and property relations among Muslims.[^20] These courts draw their authority from the Qur'an and Sunnah. Their rulings require qualified Shari'ah judges trained in Islamic jurisprudence.

AI does not have Islamic jurisprudential training. It cannot weigh competing interpretations of hadith. It cannot consider the specific circumstances of a family dispute with the pastoral sensitivity that Islamic law requires. It cannot issue a ruling that carries religious and legal authority.

**What AI may do:** Organize case records for Shari'ah court clerks. Compile relevant precedents from prior court decisions. Format pleadings and legal documents. These are clerical functions.

**What AI must not do:** Recommend a ruling. Suggest how Islamic law should apply to a specific case. Generate a fatwa or anything resembling one. Draft a Shari'ah court decision.

### Category 2: Political Negotiations

**AI must not participate in political negotiations.** The Bangsamoro peace process — from the Comprehensive Agreement on the Bangsamoro (2014) through the BOL's ratification (2019) and the ongoing normalization process — was built on human trust between parties who fought each other for decades.[^21] Political negotiations within the BTA — coalition-building, committee assignments, legislative bargaining — depend on relationships, cultural norms, and political judgment that no AI possesses.

**What AI may do:** Prepare background research for negotiators. Summarize historical agreements. Compare provisions across different drafts. These are research functions.

**What AI must not do:** Recommend negotiation positions. Predict political outcomes. Draft compromise language without explicit human direction on the terms of the compromise.

## Category 3: Cultural Determinations

**AI must not make cultural judgments.** The Bangsamoro region includes 13 ethnolinguistic groups with distinct traditions, customary laws, and cultural heritage.[^22] Determining whether a cultural practice should be preserved, how a tradition should be represented, or whether a heritage site qualifies for protection requires cultural expertise that AI does not have.

**What AI may do:** Assist in cultural documentation — transcribing oral histories, organizing artifact catalogs, mapping heritage sites.

**What AI must not do:** Determine the cultural significance of a practice. Recommend which traditions merit preservation. Represent any ethnolinguistic group's cultural values or positions.

## Category 4: Disciplinary Actions

**AI must not recommend disciplinary actions against government personnel.** The Bangsamoro Civil Service Code establishes due process requirements for administrative proceedings.[^23] Disciplinary actions affect livelihoods, reputations, and careers. They require the procedural safeguards that only human judgment can provide.

**What AI may do:** Compile attendance records, performance data, and prior corrective actions to support a supervisor's review.

**What AI must not do:** Recommend termination, suspension, or demotion. Assess whether an employee's behavior constitutes a violation. Draft the finding of fact in an administrative case.

## Category 5: Decisions Affecting Indigenous Peoples' Rights

**AI must not make decisions affecting the rights of non-Moro indigenous peoples.** BOL Article IX recognizes indigenous peoples' rights.[^24] The Teduray, Lambangian, Dulangan Manobo, and B'laan communities within BARMM have distinct governance traditions and customary laws that predate both Philippine national law and Islamic governance structures.[^25]

**What AI may do:** Assist in documenting IP customary laws and governance practices. Compile data for IP community development plans.

**What AI must not do:** Determine land use boundaries in ancestral domains. Recommend policies that affect IP communities without those communities' direct participation. Generate analysis that treats non-Moro IPs as a footnote to Bangsamoro governance.

## Category 6: Life-and-Death Decisions

**AI must not participate in decisions that directly affect human life and safety.** Disaster response triage, security threat assessments, and public health emergency decisions must remain fully human.

**What AI may do:** Compile weather data, analyze historical disaster patterns, and organize evacuation logistics information.

**What AI must not do:** Determine which communities receive emergency aid first. Assess which security threats are credible. Decide which patients receive scarce medical resources.

## The Boundaries List

For quick reference, post this list in your office alongside Table 12.1:

**AI MUST NOT:**

1. Issue, simulate, or recommend Shari'ah rulings
2. Recommend political negotiation positions
3. Make cultural judgments about Bangsamoro heritage
4. Recommend disciplinary actions against personnel
5. Determine policies affecting indigenous peoples' rights without IP participation
6. Make decisions that directly affect human life and safety
7. Replace the signature authority of any accountable public servant
8. Operate without a designated human decision-maker
9. Process classified security or peace-process documents on external systems
10. Deny government services to citizens without human review

**If you are unsure whether AI should be involved in a decision, apply this test:** Would you be comfortable if a newspaper reported that this decision was made with AI assistance? If the answer is no — or even "maybe" — keep AI out of it.

## Chapter Summary

This chapter established the ethical foundation for AI adoption in BARMM governance. The foundation is not imported. It is Bangsamoro.

**The 12 Pillars of Moral Governance** apply to AI just as they apply to every other government tool. Table 12.1 maps each pillar to a specific AI governance obligation. **Transparency and Honesty** — Pillar 3 — requires that every AI-assisted document be labeled, that AI's contribution be identified, and that human verification be confirmed.

**Four Islamic principles** — amanah, adl, shura, and maslahah — create guardrails that predate AI by over a millennium. Amanah protects data. Adl prevents bias. Shura requires consultation. Maslahah demands public benefit.

**The Enhanced 12-Point Priority Agenda** benefits from AI in every priority area — and requires ethical boundaries in every priority area. Table 12.3 maps the opportunities and the limits.

**Five categories of risk** — bias, data sovereignty, over-dependency, digital divide, and inequality — require specific safeguards. None of these risks is hypothetical. All are present today.

**Seven principles** constitute a proposed Bangsamoro AI Ethics Framework, rooted in Islamic governance and Moral Governance traditions. Each principle is actionable. Each one names a specific obligation.

**Six categories of decisions** must exclude AI entirely or restrict it to clerical support: Shari'ah rulings, political negotiations, cultural determinations, disciplinary actions, IP rights decisions, and life-and-death decisions.

The principle that runs through this entire guidebook reaches its sharpest expression in this chapter: **AI is a tool. You are the authority. The ethics are yours.**

---

## Footnotes

[^1]: The 12 Pillars of Moral Governance are drawn from the 2nd Bangsamoro Development Plan 2023-2028, Chapter 5: Improving and Strengthening Governance.

[^2]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 5, Section on "Twelve Pillars of Moral Governance."

[^3]: Republic Act No. 11054 (Bangsamoro Organic Law), Article IV, General Principles and Policies. Signed July 27, 2018; ratified January-February 2019.

[^4]: Republic Act No. 11054, Article X, Section 1. The Shari'ah justice system recognizes the Qur'an and Sunnah as principal sources.

[^5]: Republic Act No. 11054, Article IX, Section 24.

[^6]: Republic Act No. 11054, Article VIII. The Wali is the ceremonial head representing the moral authority of the Bangsamoro people.

[^7]: *Supervision in Bangsamoro Governance: A Competency-Based Guidebook for BARMM Supervisors*, Chapter 1: "The Supervisor's Role in Bangsamoro Governance," Section 1.1.1 (Islamic Leadership Principles — Amanah). The supervision guidebook defines amanah as the ethical foundation of all supervisory responsibility in BARMM.

[^8]: Republic Act No. 10173 (Data Privacy Act of 2012). This national law applies within BARMM and governs the processing of personal information by government agencies.

[^9]: Hadith narrated by Abdullah ibn Umar, collected in Sahih al-Bukhari (No. 7138) and Sahih Muslim (No. 1829).

[^10]: The Qur'an, Surah An-Nisa (4:135). Translation follows the Sahih International rendering.

[^11]: The 2nd Bangsamoro Development Plan 2023-2028, Chapter 6 (Cultural Diversity), identifies 13 ethnolinguistic groups comprising 11 Islamized and 4 non-Moro indigenous peoples within the Bangsamoro.

[^12]: The Qur'an, Surah Ash-Shura (42:38). Translation follows the Sahih International rendering.

[^13]: Republic Act No. 11054, Article IX (Basic Rights). Section 24 specifically addresses the right to culture and identity.

[^14]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 5, Section on "Enhanced 12-Point Priority Agenda."

[^15]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 6 (Cultural Diversity). The 13 ethnolinguistic groups include 11 Islamized groups (Maguindanaon, Meranao, Iranun, Tausug, Sama, Yakan, Sangil, Molbog, Jama Mapun, Kalagan, Kalibugan) and 4 non-Moro indigenous peoples (Teduray, Lambangian, Dulangan Manobo, B'laan).

[^16]: Republic Act No. 11054, Article VI (Intergovernmental Relations) establishes mechanisms for coordination between the national government and the Bangsamoro government, including the Intergovernmental Relations Body (IGRB).

[^17]: *Supervision in Bangsamoro Governance: A Competency-Based Guidebook for BARMM Supervisors*, Chapter 1. The guidebook frames the supervisory role as one of developing staff capacity, not just managing outputs.

[^18]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 8 (Harnessing Technology and Innovations). The BDP notes infrastructure challenges particularly in island provinces.

[^19]: UNESCO Recommendation on the Ethics of Artificial Intelligence (2021); OECD Principles on AI (2019); EU AI Act (2024). These frameworks address AI governance in general terms but do not account for Islamic governance traditions or the specific constitutional structure of autonomous regions within unitary states.

[^20]: Republic Act No. 11054, Article X, Sections 1-10. Shari'ah courts have jurisdiction over personal law (marriage, divorce, inheritance, custody) and property relations among Muslims within BARMM.

[^21]: The Comprehensive Agreement on the Bangsamoro (CAB), signed March 27, 2014, between the Government of the Philippines and the Moro Islamic Liberation Front (MILF), provided the framework for the BOL.

[^22]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 6 (Cultural Diversity).

[^23]: Bangsamoro Autonomy Act No. 17 (Bangsamoro Civil Service Code), enacted February 2021. Establishes personnel management standards, including due process for administrative proceedings.

[^24]: Republic Act No. 11054, Article IX (Basic Rights). Section 24 recognizes the rights of indigenous peoples within BARMM.

[^25]: 2nd Bangsamoro Development Plan 2023-2028, Chapter 6. The non-Moro indigenous peoples — Teduray, Lambangian, Dulangan Manobo, and B'laan — maintain distinct governance traditions and customary laws including the Walay na Bityara (Maguindanaon) and Taritib ago Igma (Meranao) systems.

# 13

# Getting Started: An Implementation Roadmap

You have read eleven chapters on what AI can do across the governance cycle. You have seen prompts, examples, and BARMM-specific applications. The question now is: **where do you start?**

The answer depends on where you are. A staff member opening Claude for the first time faces a different challenge than a ministry director drafting an AI adoption policy. A lone researcher experimenting with NotebookLM operates in a different reality than a Parliament committee secretariat standardizing AI-assisted briefers across twelve standing committees.

This chapter gives you the roadmap. It maps three maturity levels — individual, team, institutional — and provides concrete actions for each. It ends with a 90-day plan that any BARMM office can adapt, and a change management framework that addresses the specific resistance patterns you will encounter in Bangsamoro government settings.

Start where you are. Move at the speed your context allows. But start.

---

## 13.1 The Three Maturity Levels

AI adoption does not happen all at once. It follows a predictable progression. Understanding where you fall on this progression prevents two common mistakes: **trying to do too much too fast** (which creates backlash and abandoned tools) and **staying at the individual level forever** (which limits AI's impact to personal productivity rather than institutional improvement).

### 13.1.1 Level 1: Individual Use and Personal Productivity

**Level 1 is one person using AI to do their own work faster.** No policy exists. No team agreement governs usage. The staff member experiments on their own initiative, learns through trial and error, and applies AI to tasks within their personal control.

**Characteristics of Level 1:**

- **One user, one tool.** A legislative researcher uses Claude to summarize committee reports. A budget analyst uses NotebookLM to analyze COA findings. Each person works independently.
- **No shared prompts or standards.** Two staff members doing the same task may prompt differently and get inconsistent outputs.

- **No institutional knowledge capture.** When a staff member discovers an effective prompt for drafting BAA summaries, that knowledge stays in their head or their personal files.
- **No quality assurance beyond the individual.** The staff member decides what to verify and how. There is no shared protocol for checking AI outputs.
- **No budget allocation.** The staff member uses free tools or pays for subscriptions personally.

**Level 1 is where every AI adoption starts.** It is valuable. It is necessary. But it is not sufficient. If your office stays at Level 1 indefinitely, you have individual efficiency gains without institutional transformation.

### 13.1.2 Level 2: Team Integration and Shared Workflows

**Level 2 is a team agreeing on how to use AI together.** The unit shares prompts. It maintains a common knowledge base. It establishes basic quality standards. AI becomes part of the team's workflow rather than an individual's side experiment.

**Characteristics of Level 2:**

- **Shared prompt libraries.** The committee secretariat maintains a set of tested prompts for legislative briefers, committee reports, and plenary preparation. New staff inherit them.
- **Common knowledge bases.** The team maintains an Obsidian vault or NotebookLM notebook that everyone contributes to and draws from. The vault contains enacted BAAs, committee records, and reference documents that give AI the context it needs.
- **Basic SOPs.** The team has written agreements: "All AI-drafted briefers go through the Senior Legislative Officer before submission." "All budget analysis outputs are verified against original GAA figures." "No confidential documents are uploaded to cloud-based AI tools."
- **Designated AI champions.** At least one team member stays current on AI capabilities and trains colleagues on new techniques.
- **Some budget awareness.** The team lead has justified subscription costs in the office budget, or the agency has secured a team-level plan.

**Level 2 is where AI begins to multiply its impact.** Instead of one person working faster, an entire unit produces higher-quality outputs with greater consistency.

### 13.1.3 Level 3: Institutional Adoption and Policy-Backed Deployment

**Level 3 is the organization making AI a formal part of how it operates.** Executive leadership has approved an AI use policy. Training programs exist. Budget lines fund subscriptions and capacity building. AI-assisted processes are documented in the office's manual of operations. Performance metrics track AI impact.

**Characteristics of Level 3:**

- **Formal AI use policy.** The office has issued a written policy governing acceptable uses, prohibited uses, data classification rules, quality assurance requirements, and accountability structures.[^1]
- **Institutional training program.** New staff receive AI orientation. Existing staff receive periodic skills updates. The training covers both technical competency and ethical guidelines.
- **Budget allocation.** AI subscriptions and training costs appear as line items in the office's annual work and financial plan.
- **Process integration.** The office's standard operating procedures explicitly incorporate AI at defined steps — with human review checkpoints built in.
- **Performance measurement.** The office tracks AI impact: time saved on routine tasks, output quality improvements, staff satisfaction, and cost-effectiveness.
- **Knowledge management infrastructure.** The institutional knowledge base is maintained, updated, and accessible to all authorized staff.

**Level 3 is the target.** Not every office will reach it in the first year. But every office should move toward it deliberately.

### Table 13.1: Maturity Level Comparison

| Dimension | Level 1: Individual | Level 2: Team | Level 3: Institutional |
|---|---|---|---|
| **Who uses AI** | Individual staff members | Defined teams or units | The entire office or ministry |
| **Governance** | None | Informal team agreements | Formal AI use policy |
| **Prompts** | Personal, ad hoc | Shared prompt library | Standardized, version-controlled |
| **Knowledge base** | Personal files | | Institutional knowledge |

| Dimension | Level 1: Individual | Level 2: Team | Level 3: Institutional |
|---|---|---|---|
| | | Shared team vault or notebook | management system |
| **Quality assurance** | Self-review | Peer review within team | Defined QA process with assigned reviewers |
| **Training** | Self-taught | Peer coaching and mentoring | Formal training program |
| **Budget** | Personal or unfunded | Team-level justification | Dedicated budget line |
| **Measurement** | Anecdotal | Basic team tracking | Institutional KPIs |

## 13.2 Level 1 — Individual Quick Wins

**You do not need permission to start using AI.** You need a free account, a clear task, and twenty minutes. Level 1 is about building your own confidence and competence before you try to convince anyone else.

### What Any Staff Member Can Do Tomorrow

Start with tasks you already do. Do not invent new tasks for AI. Take the work sitting on your desk right now and ask: **which part of this task is information processing that AI could help with?**

The table below maps eight common BARMM roles to their highest-value first AI tasks. Each entry includes the role, the task, the estimated time savings, the recommended tool, and a sample prompt opening. Use this as your starting point.

### Table 13.2: Quick Wins by Role

| Role | First AI Task | Time Saved | Tool | Sample Prompt Start |
|---|---|---|---|---|
| **Legislative Researcher** | Summarize a 50-page committee hearing transcript into a 2-page briefer | 3-4 hours per transcript | Claude | "Summarize this committee hearing transcript. Extract: key issues discussed, positions taken by each speaker, decisions made, action items assigned..." |
| **Budget Analyst** | Compare two fiscal years of ministry budget allocations and | 2-3 hours per comparison | Claude or NotebookLM | "Compare the FY 2025 and FY 2026 budget allocations for [Ministry]. For |

| Role | First AI Task | Time Saved | Tool | Sample Prompt Start |
|---|---|---|---|---|
| | flag variances above 10% | | | each program, show the year-over-year change..." |
| **Legal/Bill Drafter** | Cross-reference a draft bill against existing BAAs for conflicts or redundancies | 4-6 hours per bill | Claude with BAA knowledge base | "Review this draft bill against the following enacted BAAs. Identify any provision in the draft that conflicts with, duplicates, or amends an existing provision..." |
| **Administrative Officer** | Draft routine correspondence (invitations, transmittal letters, acknowledgments) | 30-60 minutes per batch | Claude | "Draft a formal transmittal letter from [Office] to [Recipient] transmitting the attached [document]. Follow Philippine government correspondence format..." |
| **Planning Officer** | Extract BDP alignment indicators for a ministry's annual work plan | 2-3 hours per plan | Claude with BDP chapters | "Review this ministry work plan and map each program/activity/project to the relevant BDP 2023-2028 goal and strategy. Flag any PPA that does not align..." |

| Role | First AI Task | Time Saved | Tool | Sample Prompt Start |
|---|---|---|---|---|
| **M&E Officer** | Generate a quarterly accomplishment report template from the ministry's targets | 1-2 hours per report cycle | Claude | "Based on these annual performance targets, create a quarterly accomplishment report template with columns for: target, Q1-Q4 actual, variance, remarks..." |
| **HR/Personnel Officer** | Summarize and compare applicant qualifications against position requirements | 1-2 hours per screening batch | Claude | "Compare the following applicant profiles against the qualification standards for [Position]. For each applicant, list: met requirements, unmet requirements..." |
| **Communications Officer** | Draft press releases and social media summaries of parliamentary actions | 1-2 hours per release | Claude | "Write a press release announcing that the BTA Parliament enacted [BAA number and title]. Include: what the law does, who benefits, key provisions..." |

## The Five Rules for Level 1 Success

1. **Start with your own work, not someone else's.** Do not volunteer to AI-optimize a colleague's process before you have optimized your own. Your credibility comes from demonstrated results.
2. **Begin with low-stakes tasks.** Draft correspondence, not position papers. Summarize documents, not make policy recommendations. Build confidence before raising the stakes.
3. **Verify everything.** At Level 1, you are the only quality control. Check every fact, every number, every citation. AI will occasionally produce plausible but incorrect outputs. Your reputation depends on catching those errors before they reach your supervisor.[^2]
4. **Save your best prompts.** When you find a prompt that consistently produces good results, save it in a file. Label it with the task it serves. You will need this library when you move to Level 2.
5. **Track your time savings.** Note how long a task took before AI and how long it takes now. You will need this data to justify AI adoption to your supervisor and budget officer.

## The First Week: A Day-by-Day Guide

Some staff members read "start tomorrow" and still do not know what to do on Tuesday. This section removes that ambiguity.

**Day 1 (Monday): Set up.** Create a free Claude account at claude.ai. Spend fifteen minutes exploring the interface. Type a simple prompt: "Explain the structure of the Bangsamoro Autonomous Region in Muslim Mindanao." Read the output. Notice what it gets right. Notice what it gets wrong. You have just completed your first AI interaction as a government employee.

**Day 2 (Tuesday): Choose your task.** Look at your work plan for the week. Identify the most time-consuming document-based task. This is your pilot. Write down how long that task normally takes you.

**Day 3 (Wednesday): Write your first work prompt.** Open Claude. Provide context: your role, the document you need, the format required, the audience. Be specific. Run the prompt. Evaluate the output honestly — what is usable, what needs revision, what is wrong.

**Day 4 (Thursday): Iterate.** Take the same task. Revise your prompt based on yesterday's results. Add more context. Specify the format more precisely. Include a reference document if you have one. Run it again. Compare.

**Day 5 (Friday): Document.** Write down: (1) the task, (2) your final prompt, (3) the time it took with AI versus without, (4) what you learned. Save this file. This is the first entry in your personal prompt library.

## Getting Started Checklist

- ☐ Create a free Claude account (claude.ai)
- ☐ Identify three recurring tasks from your current workload
- ☐ Write your first prompt for the simplest of those three tasks
- ☐ Run the prompt and compare the output against what you would have produced manually
- ☐ Revise the prompt based on what worked and what did not
- ☐ Save the revised prompt in a personal prompt library file
- ☐ Track the time you spent (prompt time + review time) versus your manual baseline

---

## 13.3 Level 2 — Team-Level Integration

**Level 2 begins when one person's success becomes the team's opportunity.** Someone on your team has been using AI effectively. Their outputs are noticeably faster, their drafts need fewer revisions, and their research is more thorough. The question shifts from "Should I try AI?" to "How do we all use it consistently?"

### Moving from Individual to Team

The transition from Level 1 to Level 2 requires three things:

1. **A team lead who supports experimentation.** The division chief, section head, or committee chairperson must explicitly authorize AI use and signal that they value the results. Without leadership support, individual AI users stay isolated.
2. **At least two people who have Level 1 experience.** You cannot build a shared practice from zero. You need at least two team members who have used AI successfully so they can compare approaches and develop shared standards.
3. **A specific workflow to standardize.** Do not try to AI-enable everything at once. Pick one recurring team process — the weekly committee briefer, the monthly budget report, the quarterly accomplishment review — and standardize AI use for that single process first.

### Shared Prompt Libraries

A **shared prompt library** is a document or folder that contains tested prompts for the team's recurring tasks. Every prompt includes:

- **The task it serves** (e.g., "Draft a committee hearing briefer for a standing committee chairperson")
- **The prompt text** (the exact wording that produces consistently good results)
- **Required inputs** (what documents or data the user needs to provide)
- **Expected output format** (what the AI should produce)
- **Quality checkpoints** (what the reviewer should verify before the output is used)

Store the prompt library where the whole team can access it. An Obsidian vault works well. A shared folder works. A Google Doc works. The format matters less than the discipline of maintaining it.

> **Example — Parliamentary Committee Secretariat Prompt Library:**
>
> A standing committee secretariat maintains prompts for: - Pre-hearing briefer (summarizes the agenda item, relevant BAAs, and ministry responses) - Post-hearing minutes (converts raw hearing transcript into structured minutes) - Committee report draft (synthesizes findings from multiple hearings into a committee report) - Follow-up tracker (generates a list of commitments made by ministry officials during hearings)
>
> Each prompt was developed by the committee's legislative officers, tested across multiple hearings, and revised based on what worked. New staff receive the prompt library on their first day.[^3]

## Building a Team Knowledge Base

A **knowledge base** is the collection of documents that gives AI the context it needs to produce BARMM-specific outputs. Without a knowledge base, AI produces generic responses. With one, it produces outputs grounded in Bangsamoro law, policy, and institutional practice.

### What goes in a team knowledge base:

| Category | Examples | Purpose |
|---|---|---|
| **Legal texts** | BAAs relevant to the team's mandate, BOL provisions, IRRs | Ensures AI references actual Bangsamoro law |
| **Policy documents** | BDP 2023-2028 chapters, ministerial development plans, executive orders | Grounds AI outputs in current BARMM policy |
| **Templates** | Standard briefer format, committee report format, correspondence templates | Ensures AI outputs match institutional formatting |
| **Historical records** | Previous committee reports, past budget analyses, prior accomplishment reports | Gives AI context for continuity and trend analysis |
| **Reference data** | Organizational structure, staff directory, committee assignments, budget allocations | Enables AI to produce outputs with correct names, titles, and numbers |

**How to build it:**

1. **Assign one person** to collect and organize the team's reference documents. This person does not need to be the most senior — they need to be the most organized.
2. **Start with the documents the team uses most frequently.** If your team produces legislative briefers, start with the enacted BAAs, the committee's past reports, and the standard briefer template.
3. **Upload to your AI tool.** Claude Projects allows you to attach reference documents. NotebookLM allows you to add multiple sources per notebook. Obsidian provides a local knowledge base that works with Claude Desktop.
4. **Update regularly.** A knowledge base that was built six months ago and never updated will produce outputs based on outdated information. Assign a monthly review.

## Prompt Versioning and Quality Control

Prompts degrade over time. AI tools update their models. Team requirements evolve. A prompt that produced excellent legislative briefers in January may produce mediocre ones by June if the model's behavior has shifted or the team's standards have changed.

**Implement basic version control:**

- **Number your prompts.** Start with v1.0. When you make significant changes, increment to v2.0. Minor tweaks become v1.1, v1.2.
- **Date every revision.** Record when the prompt was last tested and who tested it.
- **Retire outdated prompts.** When a prompt no longer produces acceptable output, mark it as deprecated and replace it. Do not leave broken prompts in the library for new staff to discover.
- **Test after AI tool updates.** When Claude, NotebookLM, or any other tool announces a major update, test your top five prompts within the first week. Flag any that produce noticeably different outputs.

## Standard Operating Procedures for AI Use

At Level 2, the team develops basic SOPs. These do not need to be elaborate. Three to five rules will cover most situations.

**Sample Team AI SOP:**

1. **All AI-assisted outputs are reviewed by at least one person before submission.** The person who generated the output cannot be the sole reviewer.

2. **Legal citations in AI-generated drafts are verified against the original text.** Do not trust AI to quote a BAA provision correctly — check it.
3. **Confidential documents are not uploaded to cloud-based AI tools.** Use Claude Desktop (local processing) for documents classified as confidential or above.
4. **The team prompt library is the starting point for recurring tasks.** Individual modifications are allowed, but the base prompt should be used for consistency.
5. **Time savings and quality improvements are logged in the team's weekly report.** This data supports future budget requests for AI subscriptions and training.

## The Level 2 Transition Checklist

- ☐ Identify at least two staff members with Level 1 AI experience
- ☐ Select one recurring team process for AI standardization
- ☐ Create an initial shared prompt library with tested prompts for that process
- ☐ Build a starter knowledge base with the team's most-used documents
- ☐ Draft a team AI SOP (3-5 rules, 1-2 pages)
- ☐ Conduct a team orientation session on the shared tools and standards
- ☐ Assign an AI Champion to maintain the prompt library and knowledge base
- ☐ Begin tracking team-level time savings and quality improvements

---

## 13.4 Level 3 — Institutional Adoption

**Level 3 is where AI stops being a team experiment and becomes an organizational commitment.** This requires executive leadership, formal policy, dedicated budget, and integration into the office's standard processes.

### What Institutional Adoption Requires

#### 1. Executive Sponsorship

The ministry head, chief of staff, or office director must champion AI adoption. This is not optional. Without executive sponsorship, AI initiatives remain at the team level because they lack the authority to change office-wide processes, allocate budget, or require participation.

The executive sponsor does not need to be an AI expert. They need to understand the value proposition: **AI-augmented staff produce more, higher-quality work with the same headcount.**[^4] In BARMM's context — where many offices are still filling plantilla positions and staff carry multiple portfolios — this proposition is compelling.

#### 2. A Formal AI Use Policy

The policy establishes what is allowed, what is required, and what is prohibited. At minimum, it covers:

- **Scope.** Which staff and which functions are covered.
- **Approved tools.** Which AI platforms are authorized for use with government work.
- **Data classification.** Which documents can be processed by cloud-based AI tools and which require local processing only.
- **Quality assurance.** The review process for AI-assisted outputs before they are submitted externally.
- **Accountability.** The human who submits an AI-assisted output takes full responsibility for its accuracy. AI does not sign documents. People do.[^5]
- **Ethical guidelines.** Alignment with the Twelve Pillars of Moral Governance and the Islamic principles discussed in Chapter 12.

See Appendix D for a complete sample AI policy adapted for a BARMM office.

#### 3. Training Infrastructure

Institutional adoption requires more than one orientation session. It requires an ongoing training program that covers new staff, skill updates, and specialized applications. Chapter 14 covers training program design in detail.

### 4. Budget Allocation

AI is not free at scale. Team-level subscriptions (Claude Pro, NotebookLM Plus, Obsidian Sync) cost money. Training workshops require facilitator time and logistics. Knowledge base maintenance requires staff time. These costs must appear in the office's annual work and financial plan.

**Budget Items to Plan For:**

| Item | Estimated Annual Cost | Justification |
|---|---|---|
| **AI tool subscriptions** (5-10 users) | PhP 120,000 - 300,000 | Enables staff access to professional-grade AI tools |
| **Training workshops** (2 per year) | PhP 50,000 - 100,000 per workshop | Builds and maintains staff AI competency |
| **Knowledge base maintenance** (staff time) | 2-4 hours/month per assigned staff | Keeps AI reference materials current and accurate |
| **External technical support** (as needed) | PhP 50,000 - 150,000 | Setup assistance, troubleshooting, advanced configuration |

These are modest investments compared to the alternative: hiring additional staff to handle increasing workloads. A single Claude Pro subscription costs roughly PhP 12,000 per year. A single additional staff member costs PhP 300,000-500,000 per year in salary alone.[^6]

### 5. Process Integration

AI must be written into the office's existing workflows, not bolted on as an afterthought. This means revising standard operating procedures to include AI-assisted steps with defined human review checkpoints.

> **Example — Integrating AI into the Budget Preparation Cycle:**
>
> The MFBM planning division revises its budget preparation SOP: - Step 1: Receive Budget Call from the Chief Minister (human) - Step 2: Compile prior year's budget execution data (human, with AI-assisted data extraction) - Step 3: Generate variance analysis between planned and actual expenditures (AI-assisted, reviewed by Senior Budget Analyst) - Step 4: Draft budget narrative for each program (AI-assisted, reviewed by Division Chief) - Step 5: Present to Ministry Head for approval (human) - Step 6: Submit to MFBM Budget Bureau (human)
>
> AI appears at Steps 2, 3, and 4. Human review gates appear at Steps 3 and 4. No step is fully automated.[^7]

### 6. Knowledge Management as Infrastructure

At Level 3, the knowledge base is no longer a team folder. It is institutional infrastructure. Treat it like you treat your office's filing system — with assigned custodians, update schedules, access controls, and retention policies.

**Institutional knowledge management requirements:**

- **Custodian assignment.** Name a staff member responsible for each knowledge base domain (legislative, budgetary, administrative, HR).
- **Update schedule.** Define when new documents are added. After every parliamentary session? After every budget cycle? After every new BAA is enacted?
- **Access controls.** Define who can read, who can add, and who can modify. Not every staff member needs write access. But every staff member needs read access.
- **Retention policy.** Define what stays and what gets archived. A knowledge base cluttered with five-year-old drafts is harder for AI to work with than a curated collection of current documents.
- **Backup.** If the knowledge base lives on a local machine, back it up. If it lives in the cloud, ensure you have a local copy. Government data should never exist in only one place.

---

## 13.5 The 90-Day AI Adoption Plan for a BARMM Office

The plan below is designed for a BARMM ministry division, parliamentary committee secretariat, or attached agency office with 5-15 staff. Adapt the timeline to your context. Some offices will move faster. Some will need more time at each phase. The sequence matters more than the speed.

### Table 13.3: 90-Day AI Adoption Plan

| Week | Phase | Activities | Responsible | Deliverable |
|---|---|---|---|---|
| **1** | **Assess** | Survey staff AI familiarity. Identify who has Level 1 experience. Map the team's top 10 recurring tasks by time spent. | Team Lead + AI Champion | Staff AI readiness survey results; Task inventory ranked by hours/week |
| **2** | **Assess** | Select three pilot tasks for AI integration. Choose tasks that are: recurring, time-consuming, document-heavy, and low-risk if errors occur. | Team Lead | List of three pilot tasks with baseline time measurements |
| **3** | **Pilot** | Set up AI tools. Create accounts. Assign one AI Champion to coordinate. Build a starter prompt for each of the | AI Champion | Tool access confirmed; Three draft prompts tested |

| Week | Phase | Activities | Responsible | Deliverable |
|---|---|---|---|---|
| | | three pilot tasks. | | |
| **4** | **Pilot** | Run the three pilot tasks using AI. Each pilot task owner runs AI-assisted and manual versions side by side. Document time, quality, and issues. | Pilot Task Owners | Pilot results log: time comparison, quality notes, issues encountered |
| **5** | **Pilot** | Review pilot results with the full team. Discuss what worked, what failed, and what needs adjustment. Revise prompts based on findings. | Team Lead + All Staff | Revised prompts; Lessons learned document |
| **6** | **Build** | Create the team's shared prompt library. Include the three pilot prompts plus any others that team members have developed individually. | AI Champion | Shared prompt library (v1) |
| **7** | **Build** | Build the team knowledge base. Collect legal texts, policy documents, templates, and reference data | Assigned Staff + AI Champion | Knowledge base with initial document set |

| Week | Phase | Activities | Responsible | Deliverable |
|---|---|---|---|---|
| | | relevant to the team's mandate. | | |
| **8** | **Build** | Draft team AI SOPs. Cover: review requirements, data handling rules, prompt library usage, and quality checkpoints. | Team Lead + AI Champion | Team AI SOP (v1, 1-2 pages) |
| **9** | **Train** | Conduct a half-day AI workshop for the full team. Cover: basic prompting, the team's prompt library, the knowledge base, and the SOPs. | AI Champion | Workshop completed; All staff trained on team tools |
| **10** | **Expand** | Expand AI use to additional tasks beyond the original three pilots. Each staff member identifies one new task from their workload. | All Staff | Expanded task list with new prompts added to library |
| **11** | **Expand** | Test expanded tasks. Review outputs. Update prompts and SOPs based on new use cases. | Team Lead + AI Champion | Updated prompt library (v2); Updated SOPs |
| **12** | **Measure** | Compile 90-day results. | AI Champion + Team Lead | |

| Week | Phase | Activities | Responsible | Deliverable |
|---|---|---|---|---|
| | | Calculate total time saved, tasks AI-enabled, staff confidence levels, and quality observations. Draft a brief report for the office head. | | 90-Day AI Adoption Report |
| **13** | **Decide** | Present results to the office head. Recommend next steps: continue at Level 2, prepare for Level 3, or adjust approach. Request budget for Year 2 if results justify it. | Team Lead | Presentation to office head; Level 3 readiness assessment |

## Critical Success Factors for the 90-Day Plan

The plan above looks straightforward on paper. In practice, five factors determine whether it succeeds or stalls:

1. **The AI Champion must have protected time.** If the champion's regular workload does not decrease, the AI adoption work becomes unpaid overtime. That is not sustainable. The team lead must explicitly reallocate at least 4-6 hours per week during the 90-day period.
2. **Week 5 is the make-or-break moment.** The team reviews pilot results and decides whether to continue. If the pilot tasks were poorly chosen (too complex, too politically sensitive, too dependent on judgment), the results will be underwhelming and momentum will die. Choose your three pilot tasks carefully. Pick tasks where AI can clearly demonstrate value.

3. **The knowledge base requires upfront effort.** Building a knowledge base is not glamorous work. It means collecting, organizing, and formatting documents. The staff member assigned to this task must understand that this foundational work enables everything that follows.
4. **The team lead must attend the Week 5 and Week 9 sessions.** If the team lead delegates these to the AI Champion, the rest of the team interprets this as a signal that AI adoption is not a leadership priority.
5. **The 90-day report must contain numbers.** "We saved time" is not a finding. "We reduced average briefer preparation time from 6 hours to 2.5 hours across 12 briefers" is a finding. Numbers sustain executive support. Impressions do not.

## Adapting the 90-Day Plan

**For smaller offices (under 5 staff):** Compress the Assess phase to one week. Combine the Build and Train phases. Your AI Champion is likely also the Team Lead.

**For larger offices (over 15 staff):** Start with one division as the pilot group. Do not try to onboard the entire ministry at once. Use the pilot division's results to justify and design the ministry-wide rollout.

**For parliamentary committee secretariats:** Align the plan with the parliamentary calendar. Start the Assess phase during recess periods when staff have more capacity. Schedule the Train phase before the next session opens so staff can apply new skills immediately.

**For island province offices (Tawi-Tawi, Sulu, Basilan):** Account for intermittent internet connectivity. Prioritize tools that work offline or with minimal bandwidth. Claude Desktop with a local knowledge base functions without a constant internet connection for many tasks. Build your knowledge base on local storage, not exclusively on cloud platforms.

**For BPDA, DAB, and other attached agencies:** Your mandates are cross-cutting. Build your knowledge base with documents from multiple ministries, not just your own. Your AI-assisted analyses will be more valuable if they draw on the full policy landscape.

See Appendix H for a printable template version of this plan.

## 13.6 Change Management: Addressing Resistance and Building Champions

AI adoption fails more often from resistance than from technology. The tools work. The prompts produce results. But people hesitate, resist, or actively undermine adoption for reasons that are entirely human and entirely predictable.

Understanding these resistance patterns — and having ready responses — is the difference between an AI initiative that stalls and one that scales.

### The Six Resistance Patterns in BARMM Government

| Resistance Pattern | What You Hear | Root Cause | Effective Response |
|---|---|---|---|
| **"This will replace my job"** | "AI is going to make us all redundant." "They will use this to cut staff." | Fear of displacement. This is the deepest and most legitimate concern. | Demonstrate that AI handles the tedious parts of the job, not the judgment parts. Show how AI-augmented staff become more valuable, not less. Point to the plantilla vacancies — BARMM has too few staff, not too many. [^8] |
| **"I am too old/not tech-savvy enough"** | "That is for young people." "I cannot even use Excel properly." | Fear of incompetence. Senior staff who have built careers on manual expertise feel threatened by a skill they do not have. | Start them with voice-to-text prompting. Show them that prompting is closer to giving instructions to a staff member than to programming. Pair them with a younger colleague for their first session. |
| **"This is haram/ against our values"** | "AI is deception." "Using AI means we | Ethical and religious concern. This is | Refer to Chapter 12 on Islamic |

| Resistance Pattern | What You Hear | Root Cause | Effective Response |
|---|---|---|---|
| | are lying about who did the work." | sincere and must be treated with respect. | principles. Emphasize transparency — disclosing AI use, not hiding it. Frame AI as a tool like a calculator or a search engine. Cite the principle of *maslahah* (public interest): if AI helps serve the Bangsamoro people better, using it responsibly is consistent with Islamic governance values.[^9] |
| **"My supervisor does not support this"** | "My boss does not believe in AI." "They will think I am wasting time." | Lack of institutional permission. The staff member wants to use AI but fears negative consequences from a supervisor who is skeptical or uninformed. | Provide the staff member with data from the pilot results. Offer to brief the supervisor. Frame AI as a tool that makes the supervisor's unit look more productive. See the Supervision Guidebook, Chapter 4, on coaching for development — the supervisor's resistance may signal a coaching opportunity, not a dead end.[^10] |
| **"The output is not good enough"** | "I tried it and it gave me garbage." "AI cannot write like a government employee." | Bad first experience. Usually caused by vague prompts, no context provided, or unrealistic expectations. | Review their prompt. Most bad outputs come from bad prompts. Teach the Four-Step Workflow (Chapter 3). Show them the difference between a one-line prompt and a structured |

| Resistance Pattern | What You Hear | Root Cause | Effective Response |
|---|---|---|---|
| | | | prompt with role, context, task, and format. |
| **"We have more pressing problems"** | "We do not even have enough computers." "Our internet connection cannot handle this." | Infrastructure and resource constraints. This is sometimes a legitimate barrier and sometimes a deflection. | Acknowledge the constraint honestly. Then show that AI works on phones (Claude's mobile interface). Show that prompting requires minimal bandwidth. Identify which tasks can be done offline and which require connectivity. Solve the infrastructure problem separately — do not let it block all progress. |

## The Hidden Seventh Pattern: Passive Compliance

The six patterns above are visible. You hear the resistance. You can respond to it. The seventh pattern is silent and more dangerous: **staff who attend the training, nod along, and never use AI.**

Passive compliance looks like adoption but produces none of the results. The staff member has an account but has not logged in since the workshop. They have access to the prompt library but have not opened it. Their weekly reports contain no mention of AI-assisted tasks.

**How to address passive compliance:**

- **Do not call it out publicly.** Shaming does not produce adoption. It produces resentment.
- **Create low-pressure opportunities.** A "prompt of the week" exercise where every staff member tries one prompt and shares their result in the team chat. No grading. No evaluation. Just practice.
- **Make it practical, not theoretical.** Give the passively compliant staff member a specific task and a specific prompt. "Try this prompt on the report you are working

on today. Tell me tomorrow if the output was useful." Remove the friction of figuring out what to try.

- **Track usage, not attitudes.** You cannot measure enthusiasm. You can measure whether someone used AI this week. Focus on the behavior, not the sentiment.

## Building AI Champions

**An AI Champion is a staff member who actively promotes, supports, and teaches AI use within their team.** Every successful AI adoption has at least one. Most successful adoptions have two to three per office.

**Who makes a good AI Champion:**

- **Curious, not necessarily technical.** The best champions are people who like learning new things, not necessarily people with IT backgrounds.
- **Respected by peers.** A champion must be someone whose colleagues trust. If the most technically capable person is also the least collaborative, they are the wrong choice.
- **Positioned in the workflow.** The champion should work on the team's core tasks, not on peripheral functions. When the champion demonstrates AI on the team's bread-and-butter work, the impact is visible to everyone.
- **Willing to teach.** A champion who hoards knowledge is not a champion. They must be willing to sit with a colleague, walk through a prompt, and troubleshoot a bad output.

**What AI Champions do:**

1. **Maintain the team's prompt library.** They add new prompts, retire outdated ones, and version-control changes.
2. **Conduct informal training.** Brown-bag sessions, desk-side coaching, and Viber group tips.
3. **Troubleshoot failures.** When a colleague's AI output fails, the champion reviews the prompt and suggests improvements.
4. **Report results to leadership.** The champion compiles data on time saved, tasks enabled, and quality improvements. This data sustains executive sponsorship.
5. **Stay current.** The champion tracks AI tool updates, new features, and emerging best practices. They bring relevant updates to the team.
6. **Connect with champions in other offices.** AI adoption is happening across BARMM. A champion in MFBM's budget division can learn from a champion in MAFAR's planning division. Encourage cross-office connections. Chapter 14,

Section 14.4 covers how to formalize these connections into a community of practice.

## The Executive Sponsor's Role

**The executive sponsor — the ministry head, director, or committee chairperson — does not need to use AI daily.** They need to do four things:

1. **Authorize experimentation.** Say publicly: "I encourage our staff to explore AI tools for their work." This single statement removes the permission barrier for dozens of staff members.
2. **Protect early adopters.** When a staff member's first AI attempt produces a subpar output, the sponsor ensures they are coached, not punished. Innovation requires tolerance for early failures. The Supervision Guidebook calls this the difference between a learning culture and a blame culture.[^11]
3. **Allocate resources.** Approve subscription costs. Allocate staff time for training. Include AI-related expenses in the annual work plan.
4. **Demand results.** After the first 90 days, ask for data. What tasks are faster? What outputs are better? What is the return on the investment? This accountability keeps the initiative focused and credible.

## The Change Management Sequence

The sequence matters. Do not skip steps.

1. **Demonstrate, do not argue.** Show a real BARMM task done with AI and without AI. Side-by-side comparison is more persuasive than any presentation.
2. **Start with the willing.** Do not waste energy converting the most resistant staff member first. Start with the curious ones. Build momentum with early adopters. The resistant will follow when they see results.
3. **Solve a real pain point.** Find the task everyone hates — the one that eats four hours every week and produces no satisfaction. Make that your first AI pilot. When AI eliminates a pain point, resistance drops sharply.
4. **Make it visible.** When the pilot produces results, share them. Post the time saved. Show the before-and-after outputs. Celebrate the team member who had the best prompt this month.
5. **Institutionalize gradually.** Do not mandate AI use on Day 1. Mandate it after the pilot has proven value, the SOPs are written, and the training has been delivered.

6. **Sustain with data.** Every quarter, compile the numbers: hours saved, tasks AI-enabled, quality improvements. Present them to leadership. Data is what keeps the budget flowing and the initiative alive.

## When AI Adoption Fails — and How to Recover

Not every 90-day plan succeeds. Some offices will reach Week 8 and realize they have stalled. The prompt library has three prompts that nobody uses. The knowledge base was built but never updated. The AI Champion was reassigned to a different priority. The team lead stopped attending review sessions.

**Diagnose before you restart.** Ask three questions:

1. **Was the pilot task well chosen?** If the team tried to AI-enable a task that requires deep institutional judgment (e.g., negotiating with stakeholders, resolving inter-agency disputes), the pilot was doomed from the start. Choose a different task — one that is more document-heavy and less judgment-heavy.
2. **Did the AI Champion have protected time?** If the champion was expected to do AI work on top of a full existing workload, burnout is the predictable result. Reallocate time before restarting.
3. **Did leadership show up?** If the team lead did not attend the review sessions, did not ask about results, and did not mention AI in any team meeting, the rest of the staff correctly concluded that this was not a real priority. Fix the leadership signal before fixing the technology.

**To recover:** Do not restart the full 90-day plan. Go back to Week 3 (pilot) with a better-chosen task, a protected champion, and visible leadership engagement. A fresh pilot that succeeds is worth more than a completed plan that produced nothing.

## What This Chapter Has Given You

You now have three maturity levels to assess where you stand. You have quick wins for eight common BARMM roles. You have a day-by-day guide for your first week. You have a team integration framework with shared prompts, knowledge bases, and SOPs. You have an institutional adoption checklist with policy, budget, process integration, and knowledge management requirements. You have a 90-day plan you can start tomorrow. You have a change management playbook that addresses six visible resistance patterns and one hidden one. And you have a recovery protocol for when plans stall.

The tools and prompts from Chapters 1-12 are your arsenal. This chapter is your battle plan.

Chapter 14 addresses the next requirement: building and sustaining the human capacity to make this plan work over time.

---

## Footnotes

[^1]: A formal AI use policy is consistent with the principle of *shura* (consultation) discussed in Chapter 12. The policy should be developed through consultation with staff, not imposed unilaterally. See Section 12.2.3 for the *shura* framework applied to AI deployment decisions.

[^2]: The "Trust but Verify" Protocol is introduced in Chapter 3, Section 3.4. At Level 1, this protocol is entirely self-directed. At Level 2, it becomes a shared team practice.

[^3]: For a detailed prompt library covering the full range of government tasks, see Appendix A (Prompt Library for Common Government Tasks).

[^4]: The Bangsamoro Development Plan 2023-2028 identifies "improving and strengthening governance" as one of six overarching development goals. AI-augmented staff capacity directly supports BDP Goal 5 by enabling existing staff to deliver more effective governance outputs. See Bangsamoro Development Plan 2023-2028, Chapter 5.

[^5]: Republic Act No. 11054 (Bangsamoro Organic Law), Art. VII, Sec. 41. "Public office is a public trust. Public officers and employees shall at all times be accountable to the people." Accountability does not transfer to an AI tool. The officer who submits the work bears full responsibility for its content.

[^6]: These cost estimates are based on published subscription prices for Claude Pro (approximately USD 20/month) and typical Salary Grade 11-15 compensation for BARMM government staff as of 2026. Actual costs vary by office and position.

[^7]: For a full discussion of AI integration into the Bangsamoro budget cycle, see Chapter 6 (AI for Budgeting and Financial Analysis), Section 6.1.

[^8]: As of 2026, many BARMM ministries and offices continue to fill plantilla positions authorized under BAA 13 (Bangsamoro Administrative Code) and BAA 85 (General Appropriations Act, FY 2026). The workforce challenge in BARMM is understaffing, not overstaffing.

[^9]: See Chapter 12, Section 12.2.4 for the *maslahah* (public interest) principle applied to AI adoption. The principle holds that actions which serve the common good and do not contradict Shari'ah are permissible. AI tools that improve government service delivery and transparency serve the public interest.

[^10]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 4 (Coaching for Performance and Development). The guidebook provides frameworks for supervisors to develop staff competencies through structured coaching conversations rather than directive mandates.

[^11]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 1, Section 1.1. The guidebook frames supervision as service (*amanah*) and establishes that supervisors who create environments where staff can learn from mistakes — rather than fear them — produce higher-performing teams over time.

# Training, Capacity Building, and Sustaining AI Skills

You can buy the best AI tools on the market. You can write a comprehensive AI use policy. You can assign an AI Champion and build a knowledge base. None of it matters if your staff cannot use AI effectively — and keep using it as the technology evolves.

Training is where AI adoption either takes root or withers. Not a single workshop. Not a one-time orientation. A sustained, structured investment in human capacity that treats AI literacy the same way government treats financial management or records management: as a **core competency** that every staff member must develop and maintain.

This chapter covers how to build that capacity. It starts with why AI literacy belongs in every government employee's competency framework. It provides a training curriculum you can adapt. It defines the supervisor's specific role in sustaining AI adoption. It shows you how to build communities of practice that outlast any single champion. And it gives you metrics to prove that your investment in AI capacity is producing results.

---

## 14.1 AI Literacy as a Core Government Competency

### The Competency Gap

BARMM government offices invest in training. Every ministry has a training budget. The Development Academy of the Bangsamoro (DAB) exists specifically to build civil service capacity.[^1] Annual training plans include leadership development, technical skills, financial management, and public administration.

But AI literacy does not appear in any of these training plans. It is not listed in the competency standards for any plantilla position. No civil service eligibility examination tests it. No performance evaluation measures it. The result is a workforce that is trained in every dimension of government work except the one that is changing most rapidly.

**This gap is not unique to BARMM.** It exists in almost every government worldwide. But BARMM has a particular urgency. The transition period demands maximum productivity from a still-growing workforce. Every unfilled plantilla position increases the workload on existing staff. Every BAA the Parliament enacts creates new implementation requirements. Every new ministry directive generates cascading documentation demands. AI does not eliminate these pressures. But AI-literate staff handle them more effectively than AI-illiterate staff.[^2]

## What AI Literacy Means for Government

**AI literacy is not programming.** It is not data science. It is not computer engineering. For a government employee, AI literacy means the ability to:

1. **Identify tasks that AI can assist with.** Knowing which parts of your work involve information processing that AI handles well (summarization, comparison, drafting, analysis) and which parts require human judgment that AI cannot replace (negotiation, stakeholder relationships, political sensitivity, ethical decisions).
2. **Write effective prompts.** Providing clear instructions with sufficient context, in the format the AI tool needs, to produce useful output. This is the skill covered in Chapters 2 and 3.
3. **Evaluate AI outputs critically.** Recognizing when AI output is accurate and useful, when it is plausible but wrong, and when it is fabricated. This skill is not taught by the AI tool. It is taught by subject-matter expertise combined with a healthy skepticism.
4. **Work within ethical and policy boundaries.** Knowing what data you can share with AI tools, what outputs require human review, and how to disclose AI assistance appropriately. This is the skill covered in Chapter 12.
5. **Adapt as tools evolve.** AI tools change rapidly. A staff member who learned Claude in January will encounter a different Claude by December. AI literacy includes the ability to learn new tools and adjust workflows without starting from zero.

## Placing AI Literacy in the Competency Framework

Every BARMM position has a set of competency requirements — technical competencies specific to the role and core competencies required across all positions. AI literacy should be added to the **core competency set** — the competencies expected of every government employee regardless of position.

### Table 14.1: AI Literacy Competency Levels

| Level | Title | Description | Target Positions |
|---|---|---|---|
| **Basic** | AI-Aware | Can use AI for simple tasks (drafting, summarizing). Understands basic prompting. Knows the office AI policy. | All staff, SG 1-10 |

| Level | Title | Description | Target Positions |
|---|---|---|---|
| **Intermediate** | AI-Proficient | Can use AI for complex tasks (analysis, cross-referencing, research synthesis). Maintains prompts and knowledge bases. Can train peers. | Technical staff, SG 11-18 |
| **Advanced** | AI-Strategic | Can design AI-integrated workflows. Can evaluate AI tools for institutional adoption. Can develop AI use policies and training programs. | Division chiefs, directors, SG 19+ |

This three-level framework maps to the three maturity levels in Chapter 13. Basic competency supports Level 1 (individual use). Intermediate competency supports Level 2 (team integration). Advanced competency supports Level 3 (institutional adoption).

# 14.2 Designing AI Training Programs for Government Staff

## Principles for Government AI Training

Government staff are not university students. They are working professionals with full task loads, competing priorities, and limited patience for training that does not connect to their daily work. Design your training accordingly.

**Seven principles for effective government AI training:**

1. **Use real tasks, not hypothetical exercises.** Every training activity should involve a document, process, or task that participants actually encounter in their work. A legislative researcher should practice summarizing an actual committee hearing transcript. A budget analyst should practice analyzing actual budget allocation data. Hypothetical scenarios produce hypothetical skills.
2. **Start with quick wins.** The first training session must produce a tangible result that participants can use immediately. If a staff member walks out of a two-hour session and uses AI successfully on a real task that afternoon, they will come back for more. If they walk out with abstract knowledge and no practical application, they will not.
3. **Separate orientation from skill building.** Orientation answers “what is AI and why does it matter?” Skill building answers “how do I use AI for my specific work?” Do not combine them. Orientation is a one-time event. Skill building is ongoing.
4. **Match training to role.** Do not put legislative researchers and administrative officers in the same advanced session. Their tasks differ. Their prompts differ. Their knowledge bases differ. Shared orientation is fine. Role-specific skill building is better.
5. **Include ethical and cultural components.** Every training session should include time for discussing the Moral Governance pillars and Islamic principles from Chapter 12. AI literacy without ethical literacy is incomplete.
6. **Build in practice time.** A training session that is 80% lecture and 20% practice produces 20% competency. Flip the ratio. Aim for 30% instruction, 70% guided practice.
7. **Plan for follow-up.** A single workshop without follow-up produces a spike of interest that decays within two weeks. Schedule follow-up sessions at 2 weeks, 4 weeks, and 8 weeks after the initial training.

## The Three-Day AI Training Curriculum

The curriculum below is designed for a ministry, attached agency, or parliamentary secretariat running its first formal AI training. It covers three days, each with a distinct focus. Adjust the timing to your office's constraints — the content can be compressed into two full days or expanded to four half-days.

### Table 14.2: Three-Day AI Training Curriculum

| Day | Theme | Sessions | Duration | Key Activities |
|---|---|---|---|---|
| **Day 1** | **AI Literacy and First Prompts** | Session 1: What AI Is and What It Is Not | 1.5 hours | Lecture + Q&A. Dispel misconceptions (Chapter 2, Section 2.6). Show live AI demo with BARMM example. |
| | | Session 2: The Four-Step AI Workflow | 1.5 hours | Teach Prepare-Prompt-Review-Refine (Chapter 3). Participants write their first prompt using a real task from their desk. |
| | | Session 3: Hands-On Practice | 2 hours | Each participant runs three prompts on tasks from their own workload. Facilitator circulates and coaches. Group shares results. |
| | | Session 4: Ethics and Responsible AI | 1 hour | Moral Governance pillars applied to AI (Chapter |

| Day | Theme | Sessions | Duration | Key Activities |
|---|---|---|---|---|
| | | | | 12). Data classification exercise. Discussion: when must AI NOT be used? |
| **Day 2** | **AI for Your Governance Function** | Session 5: Role-Specific AI Applications | 2 hours | Breakout groups by function (legislative, budget, planning, admin, M&E). Each group works through prompts specific to their role. Uses prompt starters from Table 13.2. |
| | | Session 6: Building and Using a Knowledge Base | 1.5 hours | Live setup: create a Claude Project or NotebookLM notebook. Participants upload their team's core documents. Test prompts with and without the knowledge base. Compare outputs. |
| | | Session 7: Quality Assurance and Verification | 1.5 hours | Exercise: identify errors in AI-generated outputs. Participants receive an AI-drafted briefer |

| Day | Theme | Sessions | Duration | Key Activities |
|---|---|---|---|---|
| | | | | with deliberate errors (wrong BAA number, misquoted provision, fabricated statistic). They must find and correct every error. |
| | | Session 8: Prompt Engineering for Complex Tasks | 1 hour | Advanced prompting: chain-of-thought, multi-step analysis, cross-referencing documents. Participants attempt one complex prompt from Appendix A. |
| **Day 3** | **Team Workflow Integration and Policy** | Session 9: Building a Shared Prompt Library | 1.5 hours | Teams compile their best prompts from Days 1-2 into a shared library. Standardize format: task, prompt, inputs, expected output, quality checkpoints. |
| | | Session 10: Drafting a Team AI SOP | 1.5 hours | Each team drafts a 1-2 page AI use SOP for their unit. Template provided. Teams present their SOPs to the group for feedback. |

| Day | Theme | Sessions | Duration | Key Activities |
|---|---|---|---|---|
| | | Session 11: The 90-Day Plan | 1.5 hours | Each team adapts the 90-Day AI Adoption Plan (Chapter 13, Table 13.3) to their office. Identify pilot tasks, assign AI Champion, set review dates. |
| | | Session 12: Closing and Commitments | 30 minutes | Each participant states one commitment: "Within two weeks, I will use AI to [specific task]." Written commitments collected. Follow-up scheduled. |

See Appendix I for detailed facilitator notes, participant handouts, and evaluation forms for each session.

## Training Logistics for BARMM Contexts

**Venue considerations.** AI training requires internet access and personal devices (laptops or smartphones). If your office lacks reliable internet, conduct the training at a venue that has it. Cotabato City hotels and the DAB training facility are common options. For island province offices, check whether the provincial capitol or a BARMM satellite office has adequate connectivity.

**Device requirements.** Participants need their own devices. AI tools work on smartphones, tablets, and laptops. If some participants lack personal devices, pair them with a colleague during hands-on sessions. Do not let device access become a barrier to training.

**Facilitator qualifications.** The facilitator must have at least intermediate AI competency (as defined in Table 14.1). They must also have BARMM government experience. A technically skilled facilitator who does not understand government workflows will produce generic training. A government-savvy facilitator who is new to AI will lack credibility during troubleshooting. Prioritize facilitators who have both.

**Language.** Conduct training in the language your participants work in — typically Filipino or English, sometimes both. The AI tools work in English, Filipino, and can accept prompts in either. Do not force participants to prompt in English if they think and work in Filipino. Show them that AI responds to Filipino prompts effectively.

---

# 14.3 The Supervisor's Role in AI Adoption

## Why Supervisors Are the Bottleneck

The Supervision and Supervisory Development Guidebook establishes that supervisors are the bridge between policy and practice.[^3] When the ministry issues a new directive, the division chief translates it into team action. When a training program ends, the section head determines whether new skills are applied or forgotten.

AI adoption follows the same pattern. **The supervisor determines whether AI training becomes AI practice.** A supportive supervisor creates space for staff to experiment, asks about AI use in weekly check-ins, and celebrates early wins. An indifferent supervisor allows AI skills to atrophy. A hostile supervisor actively discourages adoption.

The Supervision Guidebook's Performance Management Cycle — Plan, Monitor, Evaluate, Improve — applies directly to AI adoption.[^4] The supervisor does not need to be the team's best AI user. They need to manage the adoption process the same way they manage any performance improvement initiative.

## The Supervisor's AI Adoption Checklist

Use this checklist during the first 90 days of your team's AI adoption. Each item is a specific action, not a vague aspiration.

**Table 14.3: Supervisor's AI Adoption Checklist**

| Week | Action | How to Do It | Done? |
|---|---|---|---|
| **Week 1** | Communicate support publicly | In a team meeting, state: "I want our team to explore AI tools for our work. I support experimentation. Mistakes during learning are expected and acceptable." | ☐ |
| **Week 2** | Identify the AI Champion | Select a staff member who meets the criteria in | ☐ |

| Week | Action | How to Do It | Done? |
|---|---|---|---|
| | | Chapter 13, Section 13.6. Discuss the role with them. Agree on protected time (4-6 hours/ week). | |
| **Week 3** | Approve pilot task selection | Review the three pilot tasks chosen by the team. Confirm they are appropriate: recurring, document-heavy, low-risk. Remove any that are too politically sensitive for a first attempt. | ☐ |
| **Week 4** | Check in on pilot progress | Ask each pilot task owner: "What did you try? What worked? What did not?" Listen. Do not evaluate. This is a learning phase. | ☐ |
| **Week 5** | Attend the pilot review session | Be present for the team's pilot results review. Ask questions. Show interest. If results are mixed, emphasize what was learned, not what failed. | ☐ |
| **Week 6-8** | Review SOPs and prompt library | Read the team's draft AI SOP. Provide feedback. Ensure quality assurance steps are realistic and enforceable. Approve the SOP for team use. | ☐ |
| **Week 9** | | | ☐ |

| Week | Action | How to Do It | Done? |
|---|---|---|---|
| | Attend the training workshop | Be present for at least the opening and closing sessions. Participate in one exercise yourself. Your visible participation signals that this matters. | |
| **Week 10-11** | Ask about AI in regular check-ins | Add one question to weekly individual check-ins: “Did you use AI on any task this week? How did it go?” This signals that AI use is expected, not optional. | ☐ |
| **Week 12** | Review 90-day data | Read the AI Champion’s 90-day report before it is presented. Verify the numbers. Prepare your own assessment: was this worth the investment? | ☐ |
| **Week 13** | Present results to your supervisor | Bring the 90-day report to the office head. Request budget for Year 2 if results justify it. Request training for yourself if you identify knowledge gaps. | ☐ |

## Coaching AI Adoption: The Four Quadrants

The Supervision Guidebook's PPR Framework — Performance, Potential, Readiness — provides a useful lens for managing AI adoption across your team.[^5] Your staff will fall into four categories:

1. **High performance + high AI adoption.** These are your champions. Give them harder AI tasks. Ask them to teach others. Recognize their contribution.
2. **High performance + low AI adoption.** These staff members produce excellent work without AI. They may see no reason to change. Do not force adoption. Instead, show them a specific task where AI would make their already-good work even better. The Supervision Guidebook calls this the "stretch" approach.[^6]
3. **Low performance + high AI adoption.** Be careful here. AI can mask weak analytical skills. A staff member who prompts AI fluently but cannot evaluate the output critically is a risk. Focus coaching on output quality and verification, not just prompting speed.
4. **Low performance + low AI adoption.** Address the performance issue first. AI is not a fix for fundamental competency gaps. If a staff member cannot write a clear memo manually, teaching them to prompt AI will produce AI-generated memos that they cannot evaluate. Build the foundation before adding the tool.

---

## 14.4 Building Communities of Practice

### What a Community of Practice Is

A **community of practice** (CoP) is a group of people who share a professional interest, meet regularly, and learn from each other. It is not a committee. It has no formal authority. It does not produce reports for a director. It exists to share knowledge, solve problems, and raise the collective skill level of its members.[^7]

For AI adoption in BARMM, a community of practice is the structure that prevents knowledge from staying trapped inside one team. When the MFBM budget division discovers a prompt that cuts variance analysis time in half, a community of practice is how that discovery reaches MAFAR's budget unit, MILG's finance section, and MBHTE's planning division.

### Starting a BARMM AI Community of Practice

**Membership.** The community includes AI Champions from different offices, plus any interested staff. Keep it voluntary. Mandatory participation kills communities of practice. Target 10-25 active members across multiple agencies.

**Meeting cadence.** Meet monthly. One hour. No more. Busy government staff will not attend two-hour meetings. Keep it focused.

**Format.** Every meeting follows the same structure:

1. **Show and Tell (20 minutes).** Two members present a prompt, workflow, or AI application they developed. They show the actual output. The group asks questions.
2. **Problem Solving (20 minutes).** One member brings a challenge: a task they tried to AI-enable and could not, a prompt that produces inconsistent results, a quality concern they cannot resolve. The group brainstorms solutions.
3. **Tool Updates (10 minutes).** One member reports on recent AI tool updates, new features, or emerging best practices relevant to government work.
4. **Action Items (10 minutes).** Each member commits to trying one new technique before the next meeting.

**Facilitation.** Rotate the facilitator role monthly. This prevents the community from depending on one person and gives every member practice in organizing and leading.

**Communication.** Create a Viber or Signal group for between-meeting communication. Members share tips, ask quick questions, and post links to useful resources. Keep the channel active but low-pressure.

## Cross-Office Learning Opportunities

The 15 line ministries, 10 attached agencies, 4 commissions, and the Parliament each face different governance tasks. But their AI challenges overlap significantly. Consider these cross-office learning pairings:

| Office A | Office B | Shared AI Challenge |
|---|---|---|
| **MFBM** Budget Division | **BPDA** Planning Division | Budget-to-plan alignment analysis |
| **Parliament** Committee Secretariats | **MILG** LGU Coordination | Cross-referencing BAAs with LGU compliance |
| **MBHTE** Education Planning | **MOH** Health Service Planning | Data-driven service delivery targeting |
| **MAFAR** Program M&E | **MSSD** Social Services M&E | Quarterly accomplishment report generation |
| **MENRE** Environmental Data | **MOST** Science and Technology | AI-assisted environmental research synthesis |
| **BWC** Gender Analysis | **BYC** Youth Development | Population-segmented policy analysis |
| **DAB** Training Design | Any Ministry Training Unit | AI-assisted training material development |

These pairings are suggestions. The community of practice will identify its own most productive connections as it matures.

## Sustaining the Community

Communities of practice die when they lose momentum. Three practices keep them alive:

1. **Celebrate wins publicly.** When a community member's AI innovation saves their office significant time or improves output quality, share the story. Write a one-

paragraph case study. Post it in the community's Viber group. Mention it in the next meeting. Recognition fuels participation.

2. **Rotate leadership.** If the same person facilitates every meeting, the community becomes their personal project. When they leave or burn out, the community dies. Rotate facilitation. Rotate who presents. Distribute ownership.
3. **Connect to institutional incentives.** If the community produces real value, advocate for its members to receive recognition in their performance evaluations. Participation in a cross-office AI community of practice demonstrates initiative, collaboration, and continuous learning — all competencies that merit recognition.

---

# 14.5 Keeping Up with AI Evolution

## The Pace of Change

AI tools change faster than any technology that government has previously adopted. Word processing reached maturity and then stabilized. Spreadsheets added features gradually over decades. Email changed slowly. Government staff learned these tools once and used them for years.

AI is different. The capabilities of Claude, GPT, Gemini, and other tools shift every few months. A technique that produced excellent results in January may be unnecessary by June because the tool improved. A limitation you worked around in March may be eliminated by September.

**This is not a reason to wait.** It is a reason to build adaptability into your training and workflow design.

## Three Strategies for Staying Current

### Strategy 1: Designate a "tool watcher" in every office.

One staff member — ideally the AI Champion — spends 30 minutes per week scanning for updates to the AI tools the office uses. They check the tool's official blog, release notes, or announcement page. When a relevant update occurs, they summarize it in one paragraph and share it with the team.

This is not a full-time job. It is a 30-minute weekly habit that prevents the entire office from being surprised by changes.

### Strategy 2: Test prompts quarterly.

Every quarter, the AI Champion or community of practice tests the office's top 10 prompts against the current version of each tool. The test confirms whether the prompts still produce the expected output quality. When prompts degrade, they are updated. When tools improve, prompts are simplified.

Build this testing into the office's regular workflow. Schedule it on the calendar. Treat it like the quarterly fire drill of AI adoption — routine, brief, and non-negotiable.

### Strategy 3: Learn from outside BARMM.

Other Philippine government agencies are adopting AI. National government agencies, regional offices, and LGUs are experimenting with the same tools. The Civil Service Commission, the Department of Budget and Management, and DICT have published or are developing AI-related policies and training programs.[^8]

Additionally, international organizations working in BARMM — UNDP, World Bank, JICA, ADB — are increasingly using AI in their development programs. Their experiences, training materials, and best practices are resources you can draw on.

Join relevant mailing lists, follow relevant organizations on social media, and attend webinars when they are offered. The investment is minimal. The return — staying current without having to discover everything independently — is significant.

## When to Adopt New Tools

Not every new AI tool deserves your attention. Government offices cannot chase every shiny technology. Use this three-question filter before investing time in any new AI tool:

1. **Does it solve a problem we actually have?** If the tool's primary use case does not match a task your office performs, skip it.
2. **Does it work with our existing workflow?** A tool that requires a complete workflow redesign is a high-risk adoption. Prioritize tools that integrate with what you already do.
3. **Does it meet our data security requirements?** A tool that requires uploading confidential government data to servers outside the Philippines may be technically excellent and still be prohibited by your office's AI policy. Check before you test.

If a new tool passes all three questions, run a small pilot. One person. One task. One week. Evaluate before expanding.

---

# 14.6 Measuring AI Impact

## Why Measurement Matters

You cannot sustain what you cannot measure. AI adoption requires budget. Budget requires justification. Justification requires data. Without measurement, AI adoption depends on enthusiasm alone — and enthusiasm fades when the next organizational priority arrives.

**Measure from Day 1.** Do not wait until the 90-day plan is complete to start collecting data. Build measurement into every phase.

## The Four Dimensions of AI Impact

AI impact in government is not a single number. It has four dimensions, each measured differently.

### Dimension 1: Efficiency (Time Saved)

This is the most visible and easiest to measure. For each AI-enabled task, record:

- **Baseline time** — how long the task took before AI
- **AI-assisted time** — how long the task takes with AI (including prompting, review, and revision)
- **Net time saved** — the difference

Aggregate these across tasks and across staff to produce a total hours-saved figure per month or quarter.

### Dimension 2: Quality (Output Improvement)

Harder to measure than efficiency, but equally important. Quality improvements include:

- **Comprehensiveness** — AI-assisted briefers cover more issues, cite more references, and address more stakeholder perspectives than manually produced briefers
- **Consistency** — AI-assisted outputs follow standardized formats because the prompt enforces the format
- **Accuracy** — AI-assisted cross-referencing catches conflicts and redundancies that manual review misses (note: this assumes proper verification, per Chapter 3)

- **Timeliness** — tasks completed on time or ahead of schedule that previously required deadline extensions

Measure quality through **supervisor assessment**. After 90 days, ask each supervisor: "Has the quality of your team's outputs changed since AI adoption? In what way?" Collect structured responses, not just impressions.

### Dimension 3: Capacity (Workload Absorption)

AI-augmented staff can handle more tasks with the same headcount. This is particularly valuable in BARMM offices with unfilled positions. Measure:

- **Additional tasks completed** — tasks the team could not handle before AI that they can now handle
- **Backlog reduction** — overdue reports, pending analyses, or delayed correspondence that has been cleared
- **Scope expansion** — new types of analysis or documentation the team now produces (e.g., comparative budget analysis that was previously too time-consuming)

### Dimension 4: Staff Development (Competency Growth)

AI adoption changes how staff think about their work. Measure:

- **AI competency levels** — how many staff have moved from Basic to Intermediate or Intermediate to Advanced (per Table 14.1)
- **Self-reported confidence** — pre- and post-training surveys measuring staff confidence in using AI for their work
- **Knowledge sharing** — how many staff have contributed prompts to the shared library or presented at the community of practice

## Table 14.4: AI Impact KPIs

| KPI | How to Measure | Frequency | Target (Year 1) |
|---|---|---|---|
| **Total hours saved per month** | Sum of (baseline time - AI time) across all AI-enabled tasks | Monthly | 40-80 hours per team of 10 |
| **Tasks AI-enabled** | Count of distinct task types using AI regularly | Quarterly | 8-12 by end of Year 1 |

| KPI | How to Measure | Frequency | Target (Year 1) |
|---|---|---|---|
| **Staff at Intermediate AI competency** | Count of staff who pass an intermediate-level skills assessment | Semi-annually | 50% of team |
| **Prompt library size** | Count of tested, maintained prompts in the shared library | Quarterly | 20-30 by end of Year 1 |
| **Knowledge base currency** | Percentage of knowledge base documents updated within the last 6 months | Quarterly | 80% or higher |
| **Supervisor satisfaction with output quality** | Structured survey (1-5 scale) on comprehensiveness , consistency, accuracy, timeliness | Quarterly | Average 3.5 or higher |
| **Staff AI confidence score** | Pre/post survey (1-5 scale) on confidence in AI-assisted task completion | Post-training; then semi-annually | Average increase of 1.5 points |
| **Community of practice participation** | Number of active members attending at least 50% of meetings | Quarterly | 15+ across offices |
| **Budget ROI** | Total estimated value of time saved / Total AI-related expenditure | Annually | 3:1 or higher |
| **Backlog reduction** | Percentage decrease in overdue tasks compared to pre-AI baseline | Quarterly | 30% reduction by end of Year 1 |

## Reporting AI Impact

**To your team:** Share monthly data in the team's regular meeting. Keep it simple. Three numbers: hours saved, tasks enabled, notable wins. Celebrate progress. Identify areas for improvement.

**To your office head:** Produce a quarterly one-page AI impact brief. Include the KPIs from Table 14.4, one or two specific examples of AI-assisted outputs, and any resource requests. The office head does not need a detailed report. They need evidence that the investment is producing results and a clear request for any additional support.

**To DAB and BPDA:** If BARMM develops a cross-ministry AI adoption initiative, the DAB (as the civil service development body) and the BPDA (as the planning authority) will need aggregate data. Standardize your reporting format now so it can be compiled later. [^9]

**To the community of practice:** Share your metrics openly. Comparison across offices is not competition. It is learning. If MFBM's budget division saves 80 hours per month and MAFAR's planning division saves 20, the question is not "who is better?" The question is "what is MFBM doing differently that MAFAR can learn from?"

## The Annual AI Capacity Review

At the end of each fiscal year, conduct a comprehensive review of your office's AI adoption. The review covers:

1. **Competency progress.** How many staff moved up in AI competency levels? Who is still at Basic? What training do they need?
2. **Tool effectiveness.** Are the current tools meeting the office's needs? Should subscriptions be renewed, upgraded, or replaced?
3. **Knowledge base health.** Is the knowledge base current, organized, and actively used? Or has it been neglected?
4. **Policy compliance.** Is the AI use policy being followed? Have there been any data handling incidents, quality failures, or ethical concerns?
5. **Budget adequacy.** Were the AI-related budget allocations sufficient? What adjustments are needed for next year?
6. **Next-year priorities.** Based on the review, what are the top three AI capacity priorities for the next fiscal year?

This annual review feeds directly into the office's annual work and financial plan. AI capacity building becomes a permanent agenda item, not a one-time project.

## What This Chapter Has Given You

You now have a framework for AI literacy as a core government competency with three defined levels. You have a three-day training curriculum with session-by-session detail that your office can run within a month. You have a supervisor's checklist that makes the leadership role in AI adoption concrete and measurable. You have a community of practice model that prevents AI knowledge from staying trapped in one team. You have three strategies for keeping up with AI evolution without being overwhelmed by it. And you have ten KPIs that prove AI adoption is producing results.

Chapter 13 gave you the battle plan. This chapter gave you the training program that produces the soldiers who can execute it.

Chapter 15 looks forward — to the first regular government, to digital governance, and to what AI-augmented Bangsamoro governance looks like beyond the transition.

---

## Footnotes

[^1]: The Development Academy of the Bangsamoro (DAB) is an attached agency under the Office of the Chief Minister, established under BAA 13 (Bangsamoro Administrative Code), Title IX. DAB is mandated to provide training and capacity development programs for the Bangsamoro civil service.

[^2]: The Bangsamoro Development Plan 2023-2028 identifies human capital development and institutional strengthening as cross-cutting strategies across all six development goals. AI literacy directly supports these strategies by enabling existing staff to produce higher-quality outputs with existing resources. See BDP 2023-2028, Chapter 5 (Governance Goal).

[^3]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 1, Section 1.2 (The Transition from Individual Contributor to Supervisor). The guidebook establishes that supervisors translate institutional directives into team-level action — the same function they serve in AI adoption.

[^4]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 1, Section 1.3.2 (The Performance Management Cycle). The four-stage cycle — Plan, Monitor, Evaluate, Improve — applies to AI adoption management the same way it applies to any performance improvement initiative.

[^5]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 2 (Assessing Performance, Potential, and Readiness). The PPR Framework provides a structured approach to evaluating staff along three dimensions, which maps directly to AI adoption coaching.

[^6]: Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region, Chapter 2, Section 2.2.4 (High Performance / High Potential — Sustain and Stretch). The “stretch” approach assigns high performers tasks that expand their capabilities without overwhelming them — applicable to introducing AI to staff who are already performing well manually.

[^7]: The concept of communities of practice was developed by Etienne Wenger. See Wenger, Etienne. *Communities of Practice: Learning, Meaning, and Identity.* Cambridge University Press, 1998. The model has been adapted widely in public administration, including by the World Bank and OECD for government capacity building programs.

[^8]: The Department of Information and Communications Technology (DICT) has published the Philippine AI Roadmap, which includes government AI adoption guidelines. The Civil Service Commission (CSC) has begun integrating digital competencies into government training frameworks. These national-level initiatives provide a policy environment that supports BARMM's own AI capacity building.

[^9]: The Bangsamoro Planning and Development Authority (BPDA), as the region's planning body established under BAA 13 (Bangsamoro Administrative Code), Title VII, is positioned to coordinate cross-ministry AI adoption reporting. DAB, as the training body, can standardize AI competency assessment across the civil service.

# The Future: AI-Augmented Bangsamoro Governance

The transition period ends. The first regular elections approach. And the Bangsamoro government faces a question that no previous iteration of Moro self-governance has confronted: **how do you build a modern, technology-augmented bureaucracy while simultaneously standing up democratic institutions for the first time?**

This chapter looks forward. It examines where AI governance is heading globally, how digital transformation connects to the AI workflows you have learned in this guidebook, what the incoming elected government will need from AI-equipped staff, and what this author asks of every reader who has made it this far.

---

## 15.1 Where AI Governance Is Heading — Global Benchmarks and BARMM Lessons

### The Global Landscape

Governments worldwide are moving from experimental AI pilots to institutional AI strategies. Three countries offer distinct models that BARMM can learn from — not because their scale matches BARMM's, but because each solved a specific problem that BARMM also faces.

**Singapore: AI as a National Strategy.** Singapore's National AI Strategy 2.0, launched in December 2023, committed S$1 billion to AI development over five years.[^1] The government embedded AI into public service delivery through platforms like **Ask Jamie** (a cross-agency virtual assistant) and **OneService** (an AI-powered municipal complaint system that routes citizen reports to the correct agency automatically).[^2] Singapore's approach treats AI not as a technology experiment but as core infrastructure — the same way BARMM treats the BOL as core governance infrastructure.

The lesson for BARMM: **you do not need Singapore's budget to adopt Singapore's mindset.** Singapore's early wins came from solving specific government bottlenecks with AI — routing citizen complaints, processing permits, analyzing policy feedback. BARMM has the same bottlenecks. The 16 ministries produce thousands of documents monthly. Citizen services span five provinces and two cities. The routing problem alone — getting the right document to the right office for the right decision — is one that AI solves well with minimal infrastructure.

**United Arab Emirates: AI as a Government Ministry.** The UAE appointed the world's first Minister of State for Artificial Intelligence in 2017.[^3] By 2023, the UAE Strategy for Artificial Intelligence had deployed AI across healthcare diagnostics, traffic management, customs processing, and judicial document analysis.[^4] Dubai's AI-powered **DubaiNow** platform consolidated over 130 government services into a single application.[^5]

The lesson for BARMM: **institutional ownership matters more than technical sophistication.** The UAE did not wait for perfect AI tools. It created a governance structure — a ministry, a strategy, an accountability mechanism — that forced adoption. BARMM already has an institutional vehicle: the Bangsamoro Planning and Development Authority (BPDA) and the Ministry of Science and Technology (MOST). What it lacks is a formal AI strategy document that assigns ownership, timelines, and metrics. Chapter 13's 90-Day Plan is a starting point. A formal **Bangsamoro AI Strategy** is the destination.

**Estonia: Digital Governance for a Small State.** Estonia, with a population of 1.3 million (roughly comparable to BARMM's Maguindanao del Norte), built the world's most advanced digital governance ecosystem.[^6] Its **X-Road** data exchange layer connects every government database. Its **e-Residency** program allows digital participation in government services from anywhere. Its **Kratt** initiative (the Estonian word for a magical servant in folklore) applies AI to automate routine administrative decisions — tax assessments, parking fines, agricultural subsidies — with full transparency about when AI is involved.[^7]

The lesson for BARMM: **small governments have an advantage in digital transformation.** Estonia's success came precisely because it was small enough to build interconnected systems. BARMM has 16 ministries, not 200 federal agencies. It has one parliament, not two legislative chambers. Its bureaucracy is young enough that legacy systems have not calcified. **The same smallness that makes BARMM's capacity thin also makes its systems reformable.**

## Table 15.1: Global AI Governance Models and BARMM Application

| Dimension | Singapore | UAE | Estonia | BARMM Opportunity |
|---|---|---|---|---|
| **Population** | 5.9 million | 9.4 million | 1.3 million | 4.4 million |
| **AI strategy** | National AI Strategy 2.0 (2023) | UAE AI Strategy (2017, updated 2023) | Kratt AI Initiative (2019) | No formal AI strategy yet |
| | Smart Nation and Digital | | | MOST and BPDA |

| Dimension | Singapore | UAE | Estonia | BARMM Opportunity |
|---|---|---|---|---|
| **Institutional owner** | Government Office | Minister of State for AI | Government CIO Office | (potential owners) |
| **Key platform** | OneService, Ask Jamie | DubaiNow (130+ services) | X-Road data exchange | e-Bangsamoro (in development) |
| **Entry point** | Cross-agency service routing | Consolidated service delivery | Automated administrative decisions | AI-augmented document workflows |
| **Budget investment** | S$1 billion over 5 years | AED 300 billion target by 2031 | Less than EUR 100 million (phased) | Minimal — tools already available |
| **BARMM lesson** | Solve specific bottlenecks first | Create institutional ownership | Small scale enables faster reform | All three lessons apply |

## What These Benchmarks Mean for BARMM

The gap between BARMM and these three countries is not technology. Claude, ChatGPT, Gemini, and NotebookLM are available to any BARMM staff member with an internet connection. The gap is **institutional intent** — a formal decision, backed by policy, that AI-augmented workflows are how this government will operate.

The BDP 2023-2028 dedicates Chapter 8 to science, technology, and innovation.[^8] As Chapter 1 of this guidebook documented, that chapter focuses almost entirely on physical infrastructure — science labs, research scholarships, a science park. It identifies the need for research and development capacity and technology-based solutions but does not address AI as a governance tool or digital transformation as a public administration strategy.[^9] The next development plan — whether it covers 2028-2034 or a different horizon — must include **digital governance and AI-augmented public administration** as explicit strategy areas. Not as aspirational language. As programs, activities, and projects with budgets, timelines, and performance indicators.

Three concrete steps bridge the BDP gap:

1. **Include "Digital Governance" as a strategy area under BDP Goal 6 (Responsive, Transparent, and Accountable Governance).** This creates a policy home for AI adoption, digital platforms, and data-driven decision-making within the development planning framework.

2. **Assign MOST as lead agency with BPDA as coordinating body.** MOST provides the technical capacity; BPDA ensures alignment with broader development goals and monitors implementation across ministries.
3. **Set measurable indicators.** Percentage of ministries with formal AI use policies. Number of staff who have completed AI literacy training. Reduction in average document processing time for standard governance outputs.

---

# 15.2 Digital Governance and e-Bangsamoro — How AI Connects to Digital Transformation

## The Platform Already Under Construction

Throughout this guidebook, you have used AI as a standalone productivity tool — prompting Claude or ChatGPT from your laptop, uploading documents manually, reviewing outputs on your screen. That is Level 1 (Individual Use) and Level 2 (Team Integration) from Chapter 13's maturity model. Level 3 — Institutional Adoption — requires something more: **a digital platform where AI is embedded into government workflows, not bolted on as a separate tool.**

That platform is **e-Bangsamoro**.

e-Bangsamoro is a four-portal e-governance system currently under development for the Bangsamoro government.[^10] Its architecture reflects the governance structure of BARMM itself:

1. **Parliamentary Portal.** Legislation tracking, bill drafting workflows, committee management, resolution filing, plenary session records. Every AI-assisted legislative workflow from Chapter 7 and Chapter 11 maps to this portal.
2. **Ministerial Portal.** Program management, implementation tracking, reporting dashboards, procurement documentation. Every AI-assisted implementation workflow from Chapter 8 maps here.
3. **Budget Portal.** Budget preparation, authorization tracking, execution monitoring, COA audit integration. Every AI-assisted budgeting workflow from Chapter 6 and every oversight workflow from Chapter 10 maps here.
4. **Citizen Portal.** Service requests, transparency dashboards, public document access, feedback mechanisms. The open government and transparency tools from Chapter 10 connect to this portal.

## How AI Transforms a Digital Platform

A digital platform without AI is a database with a user interface. Staff enter data. The system stores it. Reports come out. This is useful but incremental — it digitizes paper processes without fundamentally changing how work gets done.

A digital platform **with** AI changes the workflow itself:

| Without AI | With AI |
|---|---|
| Staff manually search 89 BAAs for relevant provisions | AI scans the full corpus and returns cross-referenced results in seconds |
| Budget analysts compare spreadsheets row by row | AI identifies anomalies, generates trend analysis, and flags underspending patterns automatically |
| Legislative staff draft briefers from scratch | AI generates structured first drafts from uploaded committee hearing transcripts and reference documents |
| Citizen complaints sit in a queue until a clerk routes them | AI classifies complaints by category, urgency, and responsible ministry, then routes them automatically |
| M&E officers compile quarterly reports from 16 ministry submissions | AI aggregates data, identifies performance gaps, and generates dashboard visualizations |
| HR staff screen hundreds of applications manually | AI compares applicant qualifications against position standards and generates shortlist recommendations for human review |

## The Digital Governance Ecosystem

e-Bangsamoro does not operate in isolation. It connects to a broader ecosystem of digital governance tools that the Bangsamoro government will build over the coming decade:

- **BangsamoroHR.** Human resource management across the BARMM bureaucracy — staffing patterns, competency tracking, training records, performance evaluation.
- **Tarbiyyah-MS.** Madrasah management — school records, asatidz (teacher) data, student enrollment, curriculum tracking for the BARMM's Islamic education system.
- **MoroMarket (e-Negosyo).** A digital marketplace connecting Bangsamoro cooperatives, social enterprises, and MSMEs to buyers.
- **SBP (School Building Program).** Infrastructure tracking for school construction and rehabilitation across BARMM.
- **IPP (Integrated Planning Platform).** Strategic planning, program design, and BDP alignment for ministries and offices.

Each of these platforms generates data. AI connects the data across platforms. A budget portal that knows how many teachers Tarbiyyah-MS tracks can cross-reference staffing costs. A parliamentary portal that knows how many school buildings SBP reports can

verify implementation claims during committee hearings. An HR system that knows which staff completed AI literacy training can feed into the capacity-building indicators that Chapter 14 defined. **AI is the connective tissue of digital governance.**

## From Guidebook Workflows to Platform Features

Every AI workflow you learned in this guidebook has a natural home in the e-Bangsamoro ecosystem:

| Guidebook Chapter | AI Workflow | Platform Destination |
|---|---|---|
| Ch 5 — Strategic Planning | AI-assisted BDP alignment, Theory of Change design | IPP |
| Ch 6 — Budgeting | Budget analysis, fiscal forecasting, COA compliance | Budget Portal |
| Ch 7 — Legislative Work | Bill drafting, legislative briefers, cross-referencing BAAs | Parliamentary Portal |
| Ch 8 — Implementation | Project management, procurement documentation | Ministerial Portal |
| Ch 9 — M&E | Performance monitoring, data visualization | Ministerial Portal + Budget Portal |
| Ch 10 — Oversight | Audit analysis, transparency reporting | Parliamentary Portal + Citizen Portal |
| Ch 11 — Codification | Legal harmonization, IRR development | Parliamentary Portal |
| Ch 12 — Ethics | AI ethics framework, Shari'ah compliance review | Cross-platform governance layer |
| Ch 14 — Training | AI literacy tracking, competency assessment | BangsamoroHR |

The path from where you are now (using AI as a personal productivity tool) to where BARMM needs to be (AI-embedded institutional workflows) runs through the digital platforms. **This guidebook taught you the skills. The platforms will scale them.**

## The Infrastructure Question

Digital platforms require infrastructure that BARMM is still building. Internet connectivity in island provinces remains inconsistent. Government offices in some municipalities still rely on paper-first processes. Power supply interruptions affect server availability.

These constraints are real. They do not invalidate the vision — they sequence it. The implementation follows the same maturity model from Chapter 13:

- **Phase 1 (Level 1-2).** AI tools run on individual devices using commercial cloud services. Staff in Cotabato City, where connectivity is strongest, pilot workflows first. No custom infrastructure required.
- **Phase 2 (Level 2-3).** Shared team platforms (NotebookLM, Obsidian vaults, shared prompt libraries) operate alongside e-Bangsamoro development. AI features are prototyped and tested.
- **Phase 3 (Level 3).** e-Bangsamoro and companion platforms deploy with AI embedded. Infrastructure investments — government data centers, improved connectivity, backup power — support sustained operations.

The BDP 2023-2028, Chapter 8 acknowledges that BARMM's ICT infrastructure needs strengthening.[^11] AI adoption does not wait for perfect infrastructure. It starts with what exists and grows with what is built.

---

## 15.3 AI and the First Regular Government — Hitting the Ground Running

### The 2026 Transition

The Bangsamoro Transition Authority was established by the BOL as a transitional government to operate until the first regular elections.[^12] Those elections are scheduled for 2025, with the first regular Bangsamoro government taking office in 2025-2026.[^13] This transition is historic. For the first time, the Bangsamoro people will elect their own parliament and chief minister under the BOL framework.

The incoming government inherits a substantial legislative and institutional foundation:

- **89 Bangsamoro Autonomy Acts** enacted by the BTA Parliament.[^14]
- **Over 570 resolutions** addressing governance, policy, and parliamentary operations.
- **16 ministries and multiple executive offices** with established (if sometimes understaffed) organizational structures.
- **A development framework** — the BDP 2023-2028 — with six goals, eight strategies, and quantified targets.
- **A fiscal system** governed by BAA 84 (Budget System Act) and the annual General Appropriations Act.

But the incoming government also inherits challenges that AI directly addresses:

### Challenge 1: Institutional Knowledge Loss

When an elected government replaces a transition authority, staff turnover is inevitable. Political appointees change. Chiefs of staff rotate. Legislative researchers who drafted bills for six years move to different offices. The institutional knowledge they carry — why a particular provision was worded that way, which ministry resisted an earlier version of a bill, what COA flagged in the 2023 audit — walks out the door with them.

**AI mitigates this through searchable institutional memory.** Chapter 10 described how to build AI-searchable knowledge bases from committee records, audit findings, and legislative histories. An incoming MP who asks, “What happened with the fisheries bill?” can query a system that returns the full legislative history — including committee deliberations, amendments, voting records, and implementation status — instead of relying on a departing staff member’s memory.

## Challenge 2: Legislative Backlog

The first regular parliament will inherit a backlog. Some BAAs need amendment based on implementation experience. IRRs for recently enacted laws need promulgation. Proposed bills that did not pass the BTA will be refiled. New legislative priorities from the elected government's platform will compete for committee time.

**AI accelerates the legislative pipeline.** The bill drafting, legislative briefing, and codification workflows from Chapters 7 and 11 allow a smaller legislative staff to process a larger volume of legislation. A newly elected MP with a mandate to file five priority bills can use AI to produce structured first drafts within weeks, not months.

## Challenge 3: Budget Execution Pressure

An elected government faces immediate pressure to deliver results. Constituents who voted for specific candidates expect visible improvements — in schools, roads, health services, livelihood programs. The budget cycle does not wait. The first regular government must prepare a General Appropriations Act almost immediately after taking office.

**AI makes budget analysis faster and more rigorous.** Chapter 6's workflows enable budget staff to analyze prior-year execution, identify underspending patterns, and draft budget proposals that learn from the BTA period's fiscal data. An incoming Chief Minister who asks, "Where did the money actually go for the past six years?" can get a data-driven answer within days.

## Challenge 4: Oversight From Day One

The first regular parliament will exercise oversight over both the incoming executive and the transition government's legacy. It will need to audit what was accomplished, what was left undone, and where funds were spent versus where they were allocated. This is an enormous analytical task.

**AI handles the volume.** The oversight workflows from Chapter 10 — COA report parsing, procurement pattern analysis, compliance tracking — give parliamentary committees the analytical capacity to conduct meaningful oversight immediately, without waiting months for staff to manually review years of records.

## Challenge 5: Citizen Expectations for Digital Government

Voters in 2025-2026 will be younger, more connected, and more digitally literate than the population that ratified the BOL in 2019. They will expect government services to be accessible online. They will expect transparency in budget execution. They will expect responsiveness. **A government that cannot meet digital expectations will face credibility gaps that erode public trust.**

AI-augmented governance is not a luxury. For the first regular government, it is a baseline competency.

## Challenge 6: Harmonizing BTA-era Laws with Elected Government Priorities

The 89 BAAs enacted by the BTA represent the transition authority's legislative judgment. An elected parliament may agree with some, disagree with others, and want to amend several. The codification and harmonization workflows from Chapter 11 become operational necessities — the new parliament needs to understand the full body of existing law before it legislates further.

**AI provides the analytical baseline.** Cross-referencing all 89 BAAs against each other and against the BOL is a task that would take a team of legal researchers months to complete manually. AI completes the initial mapping in hours, flagging overlaps, gaps, and potential conflicts for human legal judgment.

## Table 15.2: How AI Helps the First Regular Government

| First 100 Days Priority | AI Application | Guidebook Reference |
|---|---|---|
| Assess BTA legacy and institutional status | AI-assisted document analysis of 89 BAAs, resolutions, and ministry reports | Ch 7, Ch 10 |
| Prepare first regular GAA | AI-assisted budget analysis of BTA-era fiscal data | Ch 6 |
| File priority legislation | AI-assisted bill drafting and legislative briefer preparation | Ch 7, Ch 11 |
| Establish oversight committees | AI-assisted COA audit analysis and compliance tracking | Ch 10 |

| First 100 Days Priority | AI Application | Guidebook Reference |
|---|---|---|
| Launch citizen services platform | AI-augmented citizen complaint routing and transparency dashboards | Ch 10, Sec 15.2 |
| Preserve institutional knowledge | AI-searchable knowledge base from BTA records | Ch 10, Ch 4 |
| Harmonize existing legislation | AI-assisted cross-referencing and codification of 89 BAAs | Ch 11 |
| Establish AI governance policy | Formal AI use policy with ethics framework, training mandate, and institutional ownership | Ch 12, Ch 13 |

## 15.4 From Guidebook to Practice — A Challenge to Every Reader

### The Honest Assessment

You have read a guidebook about using AI to improve Bangsamoro governance. You have seen sample prompts, workflow diagrams, case studies, and implementation roadmaps. You know the theory. You understand the tools. You have reference material in the appendices that you can open tomorrow morning and start using.

None of that matters if you close this guidebook and go back to working the way you worked before you opened it.

### The Author's Perspective

I wrote this guidebook from a specific position. I have drafted bills for the Bangsamoro Parliament, built AI-powered legislative research tools, managed scholarship programs, led strategic planning sessions, and supervised staff across multiple BARMM offices. [^15] I am also a software developer who has built eight government-scale platforms for Bangsamoro institutions — from e-Bangsamoro's four-portal e-governance system to BangsamoroHR, from the Tarbiyyah madrasah management system to MoroMarket's co-operative marketplace. I maintain 129 AI skills that power the kinds of workflows described in every chapter of this guidebook.

I share this not as credentials but as context. **The workflows in this guidebook are not theoretical.** They come from years of doing the actual work — drafting legislation, preparing briefers, analyzing budgets, building systems — inside the Bangsamoro government. I wrote the prompts because I use the prompts. I designed the workflows because I follow the workflows. The case studies are drawn from real legislative and administrative processes, not hypothetical scenarios.

When I started using AI tools in government work, no guidebook like this existed. I learned by experimenting — testing prompts against actual BAAs, feeding real committee hearing transcripts into AI tools, comparing AI-generated budget analysis against manual spreadsheet work. Some experiments failed. The AI hallucinated BAA numbers. It attributed provisions to wrong articles. It generated plausible but incorrect legal reasoning. Every failure taught me something about how to structure prompts, supply context, and verify outputs. The "Trust but Verify" protocol in Chapter 3 was not invented in a classroom. It was forged from real errors in real government documents.

This guidebook is the distillation of those lessons. It is the resource I wish I had when I started.

## A Challenge to Staff

If you are a government employee reading this — a legislative researcher, a budget analyst, a planning officer, a program coordinator, an executive assistant — here is what I ask of you:

**Pick one task you do every week. Just one.** A recurring report. A regular briefer. A monthly data compilation. A standard memorandum. Choose the task you find most tedious, most time-consuming, or most repetitive.

Now go to Chapter 3. Follow the Four-Step AI Workflow. Prepare your context. Write a clear prompt. Review the output critically. Refine it. Compare the result against what you would have produced manually.

If the AI-assisted version is faster, use it next week. If it is better, make it your default. If it fails, analyze why — check whether you supplied enough context, whether your prompt was specific enough, whether you verified the output against authoritative sources.

**One task. One week. That is all I ask.**

The Bangsamoro government does not transform because a guidebook says it should. It transforms because individual staff members change how they work. One prompt at a time. One workflow at a time. One verified output at a time.

## A Challenge to Supervisors

If you are a division chief, a director, or a minister: **your staff will not adopt AI unless you demonstrate that it is acceptable.** Organizational culture flows from the top. If you treat AI outputs with suspicion — if you reject AI-assisted drafts purely because they were AI-assisted, regardless of quality — your staff will stop trying.

Chapter 14 gives you the training framework. Chapter 13 gives you the implementation roadmap. Appendix D gives you a sample AI policy you can adapt for your office. What you need to supply is **permission**. Tell your staff that AI-assisted work is welcome. Set quality standards — the "Trust but Verify" protocol from Chapter 3 — but do not penalize experimentation.

The best supervisors I have worked with in BARMM share a common trait: they care about the quality of the output, not the method used to produce it. If an AI-assisted briefer is more thorough, better structured, and more accurately cited than a manually written one, the method should not matter. The result should.

## A Challenge to Members of Parliament

If you are an incoming Member of Parliament — whether you served in the BTA or are entering office for the first time — **your legislative capacity depends on your staff's AI literacy.** An MP with AI-literate staff can file better-researched bills, deliver more thorough interpellation, exercise more rigorous oversight, and respond to constituents faster.

You do not need to use AI yourself (though Chapter 2 makes it accessible if you want to). You need to ensure that your legislative office uses it. Allocate budget for AI tool subscriptions. Send your researchers to AI training. Adopt the legislative workflows from Chapter 7. Make the 13-Section Legislative Briefer from Appendix F your office standard.

The BTA Parliament enacted 89 BAAs in six years. The first regular parliament will face higher expectations with less institutional tolerance for a learning curve. AI is how your office meets those expectations.

## A Challenge to the Bangsamoro Government

If you are reading this from the Office of the Chief Minister, from BPDA, from MOST, or from any office with institutional authority over technology policy: **BARMM needs a formal AI strategy.**

Not a vague endorsement of innovation. A strategy document with:

- **An institutional owner.** Which office is responsible for AI governance across BARMM?
- **A training mandate.** Which staff categories must complete AI literacy training, and by when?
- **An ethics framework.** How does BARMM ensure AI use aligns with moral governance and Islamic values (Chapter 12)?
- **A procurement policy.** Which AI tools are approved for government use? How are they funded?
- **Performance indicators.** How does BARMM measure whether AI adoption is improving governance outcomes?
- **A digital platform roadmap.** How do e-Bangsamoro and related systems evolve to embed AI into institutional workflows (Section 15.2)?
- **A capacity building plan.** How does the government build and retain AI-literate staff across all 16 ministries and satellite offices in provinces and municipalities (Chapter 14)?

Estonia did it with 1.3 million people. Singapore did it as a city-state. The UAE did it by creating a ministry. BARMM can do it with a **Bangsamoro Executive Order on AI-Augmented Governance** — a policy instrument that the Chief Minister can issue, that BPDA can implement, and that Parliament can oversee.

## The Thread That Connects Everything

I have spent my career at the intersection of governance, technology, and development in the Bangsamoro region. I drafted the Bangsamoro Local Governance Code at MILG. I managed the AHME Scholarship Program at MBHTE. I built legislative research tools for Parliament. I founded MoroTech and MoroAcademy to extend technology and training beyond government walls. This guidebook sits at that same intersection.

It is not a technology manual — it is a governance guidebook that uses technology as a force multiplier. It is not a policy paper — it is a practical handbook that you can use tomorrow. It is not a vision document — it is a collection of workflows, prompts, and protocols that work today, with tools that are available right now, at costs that range from free to modest.

The Bangsamoro Autonomous Region represents one of the most ambitious self-governance projects in Southeast Asia. The Bangsamoro Organic Law created a framework. The BTA built the institutions. The first regular government will test whether those institutions can deliver for the people they serve.

AI does not determine whether that test succeeds or fails. **The people working inside those institutions determine that.** AI is the tool that gives those people more time to think, more capacity to analyze, more speed to deliver, and more rigor to verify.

Use it.

---

# Glossary

This glossary defines terms used throughout this guidebook. Definitions are written in plain language for government staff who may be encountering these concepts for the first time. Terms are organized alphabetically.

---

**ADDRESS IT** — A seven-step methodology for Complete Staff Work (CSW) used across BARMM offices. The acronym stands for: Analyze context, Define/Deliberate the problem, Develop options, Research, Explore options, Submit, Sustain implementation, and Iterate. See Appendix E for the AI-enhanced version.

**Adl (Justice)** — An Islamic principle requiring fairness and equity. In the AI context, Adl demands that AI-assisted decisions do not create or reinforce bias against any group. See Chapter 12, Section 12.2.2.

**AI (Artificial Intelligence)** — Computer systems that perform tasks normally requiring human intelligence. In government work, AI typically means tools that read, write, summarize, translate, and analyze text. This guidebook focuses on generative AI tools that produce text outputs from text inputs.

**AI Agent** — An AI system that can perform multi-step tasks autonomously, breaking down complex requests into subtasks, using tools, and making intermediate decisions. More capable than a single-prompt interaction. Government applications include automated document routing and legislative research assistants.

**AI Ethics Framework** — A set of principles and rules governing how an organization uses AI. Chapter 12 proposes a Bangsamoro-specific framework grounded in moral governance and Islamic values. See also: Amanah, Adl, Maslahah, Shura.

**AI Hallucination** — When an AI tool generates text that sounds correct but is factually wrong. Examples include citing a BAA number that does not exist, attributing a provision to the wrong article, or inventing a statistic. Chapter 3's "Trust but Verify" protocol addresses this risk.

**AI Literacy** — The ability to understand what AI can and cannot do, write effective prompts, evaluate AI outputs critically, and integrate AI tools into professional workflows. Chapter 2 provides the foundation. Chapter 14 covers training programs.

**AI Strategy** — A formal government document that assigns institutional ownership, training mandates, ethics standards, procurement policies, and performance indicators for AI adoption. Section 15.4 calls for a Bangsamoro AI Strategy.

**Algorithm** — A set of step-by-step instructions that a computer follows to complete a task. AI tools use algorithms to process text, recognize patterns, and generate outputs.

**Amanah (Trustworthiness)** — An Islamic principle requiring honesty and reliability. In the AI context, Amanah demands that AI-assisted outputs are verified for accuracy before submission. See Chapter 12, Section 12.2.1.

**API (Application Programming Interface)** — A set of rules that allows one software application to communicate with another. APIs enable AI tools to connect with government platforms like e-Bangsamoro.

**Automation** — Using technology to perform tasks without continuous human intervention. In government, automation ranges from auto-routing citizen complaints to generating standard reports. AI adds intelligence to automation by handling unstructured tasks like summarization and analysis.

**BAA (Bangsamoro Autonomy Act)** — Legislation enacted by the Bangsamoro Parliament. As of March 2026, the BTA Parliament has enacted 89 BAAs covering administrative structure, civil service, education, public finance, and other governance domains.

**BARMM (Bangsamoro Autonomous Region in Muslim Mindanao)** — The autonomous political entity in the southern Philippines created by the Bangsamoro Organic Law (Republic Act No. 11054). BARMM replaced the Autonomous Region in Muslim Mindanao (ARMM) in 2019.

**BDP (Bangsamoro Development Plan)** — The medium-term development framework for BARMM. The 2nd BDP covers 2023-2028 and contains six goals, eight strategies, and quantified socioeconomic targets. Referenced throughout this guidebook, especially Chapter 5.

**Bias** — Systematic errors in AI outputs that favor or disfavor certain groups, perspectives, or outcomes. Bias can enter through training data, prompt design, or the absence of local context. Chapter 12 addresses bias in the context of Islamic values and moral governance.

**BOL (Bangsamoro Organic Law)** — Republic Act No. 11054, the foundational law that created BARMM and established its governance structure. The BOL defines Parliament's powers, the Chief Minister's authority, the fiscal framework, and the rights of the Bangsamoro people.

**BPDA (Bangsamoro Planning and Development Authority)** — The BARMM ministry responsible for development planning, coordination, and monitoring. BPDA manages the BDP and coordinates with national planning agencies.

**BTA (Bangsamoro Transition Authority)** — The transitional government established under BOL Article XVI to govern BARMM until the first regular elections. The BTA exercises both legislative and executive powers.

**Budget Portal** — One of e-Bangsamoro's four portals. Handles budget preparation, authorization tracking, execution monitoring, and COA audit integration. See Section 15.2.

**Chain of Thought** — A prompting technique where you ask the AI to show its reasoning step by step before giving a final answer. Useful for complex analytical tasks like legal analysis or budget comparison, because you can see where the reasoning goes wrong and correct it.

**Chatbot** — An AI application designed to simulate conversation with users. Government chatbots handle citizen inquiries, route service requests, and provide information. Singapore's Ask Jamie is an example.

**Citizen Portal** — One of e-Bangsamoro's four portals. Provides public access to government services, transparency dashboards, document repositories, and feedback mechanisms. See Section 15.2.

**Claude** — An AI assistant developed by Anthropic. Claude is one of the primary AI tools referenced in this guidebook for text generation, document analysis, research synthesis, and workflow automation.

**Cloud Computing** — Delivering computing services (storage, processing, software) over the internet rather than from local hardware. Most AI tools run on cloud infrastructure. Government use requires awareness of where data is stored and processed.

**COA (Commission on Audit)** — The constitutional body that audits all government agencies in the Philippines, including BARMM. COA annual audit reports are the primary source material for parliamentary oversight. See Chapter 10.

**Codification** — The process of organizing, harmonizing, and consolidating enacted legislation into a systematic legal code. Chapter 11 covers AI-assisted codification of the 89 BAAs.

**Complete Staff Work (CSW)** — A methodology requiring that any document submitted to a decision-maker is complete, accurate, and ready for signature. BARMM uses the ADDRESS IT framework for CSW. See Appendix E.

**Context Window** — The maximum amount of text an AI tool can process in a single conversation. Larger context windows allow you to upload longer documents. As of 2026, leading AI tools support context windows ranging from 128,000 to 1,000,000 tokens.

**Cross-Referencing** — Comparing provisions across multiple laws, policies, or documents to identify overlaps, conflicts, or gaps. AI excels at cross-referencing large document sets. See Chapter 7, Section 7.2.3.

**Dashboard** — A visual display that presents key data and performance indicators in a single view. AI-assisted dashboards automate data aggregation and visualization. See Chapter 9.

**Data Classification** — The process of categorizing government data by sensitivity level (public, internal, confidential, restricted). Determines which documents can be uploaded to AI tools and which require additional safeguards. See Chapter 4.

**Data Privacy** — The protection of personal and sensitive information from unauthorized access, use, or disclosure. Chapter 4 covers data classification and privacy safeguards for AI use in government. The Data Privacy Act of 2012 (Republic Act No. 10173) governs data protection in the Philippines.

**Digital Governance** — The use of digital technologies to improve government operations, service delivery, transparency, and citizen engagement. This guidebook treats AI as one component of a broader digital governance strategy.

**Digital Literacy** — The ability to use digital tools and technologies effectively. AI literacy (defined separately) is a subset of digital literacy focused specifically on AI tools and workflows.

**Digital Transformation** — The process of fundamentally changing how an organization operates by integrating digital technology into all areas of work. Goes beyond digitizing paper forms to redesigning workflows around technology capabilities.

**e-Bangsamoro** — A four-portal e-governance platform under development for the Bangsamoro government. Portals: Parliamentary, Ministerial, Budget, and Citizen. See Section 15.2.

**e-Governance** — The use of information and communication technology (ICT) to deliver government services, exchange information, and enable transactions between government and citizens, businesses, and other government agencies.

**Embedding** — A mathematical representation of text that captures its meaning as numbers. AI systems use embeddings to understand how words and documents relate to each other. Enables semantic search — finding documents by meaning rather than exact keyword matches.

**Ethics** — The moral principles governing the use of AI in government. Chapter 12 grounds AI ethics in both secular governance principles (moral governance, transparency, accountability) and Islamic values (Amanah, Adl, Shura, Maslahah).

**Explainability** — The ability of an AI system to describe how it reached a particular output or recommendation. In government, explainability matters because decisions must be justifiable to oversight bodies and the public. If you cannot explain why the AI produced a result, you should not rely on that result for official action.

**Few-Shot Prompting** — A prompting technique where you include two or three examples of the desired output format in your prompt. The AI uses these examples as a template. Effective for standardizing output format across different tasks.

**Fine-Tuning** — The process of training an existing AI model on a specific dataset to improve its performance for a particular domain. Fine-tuning a model on BARMM legislation would make it more accurate on Bangsamoro legal questions. Requires technical expertise and computing resources.

**GAA (General Appropriations Act)** — The annual law that authorizes government spending for a fiscal year. In BARMM, the GAA is enacted by Parliament based on the Chief Minister's proposed budget. See Chapter 6.

**Gemini** — An AI model developed by Google. Available through Google's AI tools and integrated into NotebookLM. One of the AI platforms referenced in this guidebook.

**Generative AI** — AI systems that create new content — text, images, code, audio — based on patterns learned from training data. This guidebook focuses on generative AI for text, which is the primary modality for government document work.

**GPT (Generative Pre-trained Transformer)** — A type of AI architecture that processes text by predicting the next word in a sequence. The "Transformer" refers to the underlying neural network design. GPT models power several commercial AI tools.

**Guardrails** — Rules and limitations built into AI systems or organizational policies to prevent harmful, inaccurate, or inappropriate outputs. Chapter 12 discusses guardrails for BARMM AI use.

**Human-in-the-Loop** — A design principle where AI systems require human review and approval before their outputs are acted upon. Every AI workflow in this guidebook follows this principle. The AI drafts; the human decides. See Chapter 3's Four-Step Workflow.

**ICT (Information and Communications Technology)** — The broader category of digital tools including hardware, software, networks, and telecommunications. AI is a subset of ICT capabilities.

**Interoperability** — The ability of different systems, platforms, or databases to exchange and use data. Interoperability between e-Bangsamoro's portals, BangsamoroHR, and other BARMM platforms is what enables AI to connect data across government functions. Estonia's X-Road is a model for interoperability.

**IRR (Implementing Rules and Regulations)** — The detailed rules issued by the executive branch to operationalize an enacted law. BAAs require IRRs to specify implementation procedures. Chapter 11 covers AI-assisted IRR development.

**Institutional Memory** — The collective knowledge, experiences, precedents, and informal practices accumulated within an organization over time. Chapter 10 describes how AI-searchable knowledge bases preserve institutional memory across leadership transitions.

**Knowledge Base** — A structured collection of documents, data, and reference materials that AI tools can search and reference. Chapter 4 covers building an institutional knowledge base for BARMM. NotebookLM (Appendix B) is one tool for creating knowledge bases.

**Large Language Model (LLM)** — An AI system trained on vast amounts of text data that can understand and generate human language. Claude, ChatGPT, and Gemini are LLMs. The "large" refers to billions of parameters (numerical values) that the model uses to process text.

**Machine Learning (ML)** — A subset of AI where systems improve their performance by learning from data without being explicitly programmed for every scenario. LLMs are one application of machine learning.

**Maslahah (Public Interest)** — An Islamic jurisprudential principle that evaluates actions based on whether they serve the public welfare. In the AI context, Maslahah is the test for whether an AI application should be adopted: does it genuinely serve the Bangsamoro people's interests? See Chapter 12, Section 12.2.4.

**Maturity Model** — A framework that describes levels of organizational capability. Chapter 13 defines three AI maturity levels for BARMM: Level 1 (Individual Use), Level 2 (Team Integration), Level 3 (Institutional Adoption).

**Ministerial Portal** — One of e-Bangsamoro's four portals. Supports program management, implementation tracking, reporting, and procurement documentation. See Section 15.2.

**MOA (Memorandum of Agreement)** — A formal document between two or more parties establishing a cooperative arrangement. In BARMM, MOAs govern intergovernmental relationships, partnership programs, and resource-sharing arrangements.

**Model** — In AI terminology, the trained software system that processes inputs and generates outputs. When this guidebook says "the AI model," it refers to the underlying system (Claude, GPT, Gemini) that powers the tool you use.

**MOP (Manual of Operations)** — A document that defines the standard operating procedures, organizational structure, and workflow processes for a government office. AI can assist in drafting and maintaining MOPs.

**Moral Governance** — A BARMM governance principle emphasizing ethical conduct, transparency, accountability, and values-based leadership. The BTA's 12 Pillars of Moral Governance inform the AI ethics framework in Chapter 12.

**MOST (Ministry of Science and Technology)** — The BARMM ministry responsible for science, technology, and innovation policy. A potential institutional owner for BARMM's AI strategy (see Section 15.1).

**Multimodal AI** — AI systems that process multiple types of input — text, images, audio, video — rather than text alone. Multimodal capabilities allow you to upload a scanned document image and have the AI extract its text, or provide a chart and have the AI describe its contents.

**Natural Language Processing (NLP)** — The branch of AI that deals with the interaction between computers and human language. NLP enables AI tools to understand prompts, extract meaning from documents, translate between languages, and generate text.

**NotebookLM** — A Google AI tool that allows users to upload documents and have AI-powered conversations with them. Useful for building topic-specific knowledge bases. See Appendix B.

**Obsidian** — A knowledge management application that stores notes as local markdown files with bidirectional linking. Used in this guidebook's author's toolkit as a persistent knowledge base. See Appendix B.

**OCR (Optical Character Recognition)** — Technology that converts scanned images of text (such as PDF scans of printed documents) into machine-readable text. Essential for making older BARMM documents accessible to AI analysis.

**Open Data** — Government data that is freely available to the public in machine-readable formats. Open data enables transparency, accountability, and citizen participation. See Chapter 10, Section 10.3.

**Open Source** — Software whose source code is publicly available and can be freely used, modified, and distributed. Several AI tools and frameworks are open source.

**Output** — The text, table, analysis, or other content that an AI tool generates in response to a prompt. All AI outputs require human review before use in official government documents.

**Parameters** — The numerical values inside an AI model that determine how it processes text. More parameters generally means more capability. Current LLMs have billions to trillions of parameters. You do not need to understand parameters to use AI effectively.

**Parliamentary Portal** — One of e-Bangsamoro's four portals. Supports legislation tracking, bill drafting workflows, committee management, and plenary session records. See Section 15.2.

**PPA (Programs, Projects, and Activities)** — The standard classification for government interventions in Philippine development planning. PPAs are the building blocks of the BDP and annual work plans. AI helps align PPAs with strategic goals and track their implementation.

**Prompt** — The text instruction you give to an AI tool. A prompt tells the AI what role to play, what context to consider, what task to perform, and what format to use for the output. Chapters 2 and 3 teach structured prompting for government work.

**Prompt Engineering** — The skill of writing effective prompts that produce accurate, useful AI outputs. Includes techniques like role assignment, context supply, format specification, and iterative refinement. Chapter 3 covers this as the "Four-Step AI Workflow."

**Prompt Library** — A maintained collection of tested, reusable prompts for common tasks. Appendix A provides a prompt library organized by governance function. Teams at Level 2 maturity share prompt libraries to ensure consistency.

**RAG (Retrieval-Augmented Generation)** — A technique where AI retrieves relevant information from a specific document set before generating its response. RAG reduces hallucination by grounding AI outputs in actual source material. NotebookLM uses a form of RAG.

**Resolution** — A formal expression of the opinion, will, or decision of the Bangsamoro Parliament. Unlike BAAs, resolutions do not have the force and effect of law. The BTA has filed over 570 resolutions.

**Role Prompting** — A technique where you tell the AI to assume a specific professional role (e.g., "You are a parliamentary oversight analyst for the Bangsamoro Parliament"). Role prompting improves output relevance and tone. Used extensively throughout this guidebook.

**Rule of Signature** — A principle stated in this guidebook: if you would not sign a document without reading it, do not submit an AI-generated document without reviewing it. The person who signs bears accountability, regardless of how the document was produced.

**Semantic Search** — Searching for documents or information based on meaning rather than exact keyword matches. AI-powered semantic search finds relevant documents even when they use different terminology than your query.

**Shari'ah** — Islamic law derived from the Quran, Sunnah, and scholarly consensus. The BOL requires that legislation and governance in BARMM be consistent with Shari'ah principles. Chapter 12 addresses Shari'ah considerations for AI adoption.

**Shura (Consultation)** — An Islamic principle requiring collective deliberation before making significant decisions. In the AI context, Shura demands stakeholder consultation before deploying AI in government processes that affect communities. See Chapter 12, Section 12.2.3.

**SOP (Standard Operating Procedure)** — A documented set of step-by-step instructions for carrying out routine operations. At Level 2 and Level 3 maturity, SOPs incorporate AI-assisted steps with defined human review checkpoints.

**Structured Output** — AI output that follows a specific format — tables, numbered lists, labeled sections, JSON — rather than free-form text. Requesting structured output makes AI responses more consistent and easier to integrate into government documents.

**System Prompt** — A set of instructions given to an AI tool that governs its behavior throughout a conversation. System prompts can establish the AI's role, define constraints, and specify output formats. Advanced AI tools allow custom system prompts.

**Template** — A pre-structured document format that standardizes outputs. This guidebook provides templates for legislative briefers (Appendix F), budget briefers (Appendix G), and the 90-Day AI Adoption Plan (Appendix H).

**Token** — The basic unit of text that an AI model processes. A token is roughly three-quarters of a word in English. Token limits determine how much text you can input and how long an output the AI can generate. When this guidebook refers to "context window," it means the total number of tokens available.

**Training Data** — The text corpus that an AI model learned from during its development. Training data determines what the model "knows." AI tools trained primarily on English-language text may perform less well on Filipino or Arabic content.

**Transformer** — The neural network architecture underlying modern LLMs. Transformers process text by calculating relationships between all words in a passage simultaneously, which enables them to understand context and generate coherent text.

**Transparency** — In AI governance, the principle that government should disclose when AI tools are used in producing official documents, analysis, or decisions. Chapter 12 proposes a BARMM transparency standard.

**Trust but Verify** — The core protocol for using AI outputs in government work, introduced in Chapter 3. Accept AI outputs as useful starting points but verify every factual claim, citation, number, and legal reference against authoritative sources before submitting.

**Vendor Lock-In** — A situation where an organization becomes dependent on a single AI provider and cannot switch without significant cost or disruption. Chapter 12's integrity pillar warns against vendor lock-in that compromises government independence.

**Verification** — The process of checking AI outputs against authoritative sources to confirm accuracy. Verification is the non-negotiable step in every AI workflow described in this guidebook. Without verification, AI outputs are drafts, not documents.

**Wali** — The ceremonial head of the Bangsamoro government, representing the moral authority of the Bangsamoro people. The office is established under BOL Article VIII, Section 2. Referenced in Chapter 12's discussion of moral governance.

**Workflow** — A defined sequence of steps for completing a task. This guidebook provides AI-augmented workflows for planning (Ch 5), budgeting (Ch 6), legislation (Ch 7), implementation (Ch 8), M&E (Ch 9), oversight (Ch 10), and codification (Ch 11).

**X-Road** — Estonia's data exchange platform that connects all government databases. Referenced in Section 15.1 as a model for BARMM's digital governance infrastructure.

**Zero-Shot Prompting** — A prompting technique where you ask the AI to perform a task without providing examples. The AI relies entirely on its training data and your instructions. Simpler than few-shot prompting but may produce less consistent formatting.

---

# Appendix A — Prompt Library for Common Government Tasks

This appendix provides ready-to-use prompts for six governance domains. Each prompt follows the structure taught in Chapters 2 and 3: role, context, task, format, constraints. Copy the prompt, replace the bracketed placeholders with your specifics, and review the output against the quality check before using it.

**How to use this library:** Find your governance domain (A.1 through A.6). Pick the prompt closest to your task. Modify the bracketed items. Run the prompt. Verify the output against the quality check listed with each prompt.

## A.1 Planning and Strategy Prompts

### Prompt A.1.1 — BDP Alignment Check

*Task:* Verify whether a proposed program aligns with BDP 2023-2028 goals.

```
You are a planning officer for a BARMM ministry.

I am preparing a program proposal for [PROGRAM NAME]. The program aims to [B
RIEF DESCRIPTION, 2-3 sentences].

Review this program against the 2nd Bangsamoro Development Plan (BDP 2023-20
28) and identify:
1. Which of the 6 BDP goals this program supports (list goal number and
name)
2. Which specific BDP strategies it addresses
3. Any BDP macroeconomic or sectoral targets it contributes to
4. Gaps — BDP goals or strategies this program does NOT address but could

Format your response as a table with columns: BDP Goal, Strategy, Target, Al
ignment Evidence, Gap/Opportunity.
```

*Expected output:* Alignment matrix table with 4-6 rows. *Quality check:* Verify BDP goal numbers and strategy names against the actual BDP 2023-2028 document.

### Prompt A.1.2 — Situational Analysis Organizer

*Task:* Structure raw data into a SWOT framework for an office strategic plan.

```
You are a planning analyst for [OFFICE NAME] in BARMM.

I will provide raw data from stakeholder consultations, performance
reports, and environmental scans. Organize this data into a SWOT analysis fo
llowing these rules:
- Strengths and Weaknesses are INTERNAL (within the office's control)
- Opportunities and Threats are EXTERNAL (in the environment)
- Each item must be specific and evidence-based, not generic
- Limit to 5-7 items per quadrant
- For each item, note the source (consultation, report, or scan)

Here is the raw data:
[PASTE YOUR DATA]
```

*Expected output:* Four-quadrant SWOT table with sourced entries. *Quality check:* Confirm internal/external classification is correct. Remove any generic items ("limited budget" without specifics).

### Prompt A.1.3 — Theory of Change Narrative

*Task:* Draft a theory of change statement for a program proposal.

```
You are a development planning specialist for BARMM.

Draft a Theory of Change narrative for the following program:
- Program: [NAME]
- Problem statement: [WHAT PROBLEM DOES IT ADDRESS]
- Target beneficiaries: [WHO]
- Key interventions: [WHAT THE PROGRAM WILL DO]
- Expected outcomes: [WHAT CHANGES SHOULD HAPPEN]

Structure the narrative as:
1. If-Then chain: "If [intervention], then [output], leading to [outcome],
contributing to [impact]"
2. Assumptions: What must be true for each link in the chain to hold
3. Risks: What could break the chain
4. Evidence base: What evidence supports each causal link

Keep it under 500 words. Write in active voice, present tense.
```

*Expected output:* Theory of change narrative with explicit causal logic. *Quality check:* Test each "if-then" link. Does the logic hold? Are assumptions realistic for BARMM conditions?

### Prompt A.1.4 — Development Indicator Formulation

*Task:* Convert a vague objective into measurable indicators.

```
I am preparing the Results Framework for [OFFICE/PROGRAM NAME].

Convert the following objective into SMART indicators:
Objective: "[PASTE YOUR OBJECTIVE]"

For each indicator, provide:
- Indicator statement (specific, measurable)
- Baseline value (or note if baseline data collection is needed)
- Target value with timeline
- Data source
- Collection frequency
- Responsible office

Generate 2–3 indicators per objective: at least one output indicator and
one outcome indicator.
```

*Expected output:* Results framework table with 2-3 indicators. *Quality check:* Each indicator must be independently verifiable. Remove any indicator you cannot actually measure with available data.

### Prompt A.1.5 — Stakeholder Mapping

*Task:* Identify and classify stakeholders for a new program or policy.

```
You are a planning officer preparing a stakeholder analysis for [PROGRAM/
POLICY NAME] in BARMM.

Map all relevant stakeholders using this framework:
- Classify by influence (high/low) and interest (high/low)
- For each stakeholder, note: name/office, role in the program, engagement s
trategy, potential risk if not engaged
- Include: BARMM ministries, national government agencies, LGUs, CSOs, priva
te sector, development partners, traditional/religious leaders, affected com
munities

Present as a table, then provide a brief engagement priority note (who to en
gage first and why).
```

*Expected output:* Stakeholder matrix with 10-15 entries. *Quality check:* Verify that no major stakeholder category is missing. Check that influence/interest classifications match reality.

### Prompt A.1.6 — GAD Analysis for Program Design

*Task:* Integrate gender analysis into a program proposal.

```
Analyze [PROGRAM NAME] for gender responsiveness. Provide: (1) gender
issues in the sector, (2) how the program addresses or fails to address
them, (3) recommended adjustments, (4) sex-disaggregated indicators, (5)
GAD budget approach. Reference RA 9710 and PCW Harmonized GAD Guidelines.

Program description: [BRIEF DESCRIPTION]
```

*Expected output:* GAD analysis with specific recommendations. *Quality check:* Confirm RA 9710 references are accurate. Ensure recommendations are actionable within BARMM context.

---

## A.2 Budgeting and Finance Prompts

### Prompt A.2.1 — Budget Variance Analysis

*Task:* Analyze year-over-year changes in a ministry's budget.

```
You are a budget analyst for the Bangsamoro Parliament.

I will provide two years of budget data for [MINISTRY NAME]:
- FY [YEAR 1] GAA allocation: [PASTE OR DESCRIBE]
- FY [YEAR 2] proposed budget: [PASTE OR DESCRIBE]

Analyze:
1. Total budget change (amount and percentage)
2. Line-item changes: which programs increased, decreased, or are new
3. Top 3 largest increases and their justification (if stated)
4. Top 3 largest decreases and potential impact
5. Personnel Services vs. MOOE vs. Capital Outlay ratio comparison
6. Flags: any unusual patterns (e.g., >50% increase in a single line item, n
ew programs without enabling legislation)

Present findings in a summary table followed by a narrative analysis.
```

*Expected output:* Variance analysis table and 300-500 word narrative. *Quality check:* Verify all dollar figures and percentages by manual calculation on the top 5 line items.

### Prompt A.2.2 — Budget Scrutiny Questions

*Task:* Generate questions for committee budget deliberations.

```
You are a committee secretary preparing budget scrutiny questions for the
Committee on [COMMITTEE NAME].

Based on the following ministry budget proposal:
[PASTE BUDGET SUMMARY OR KEY FIGURES]

Generate 10 scrutiny questions covering:
- Utilization rate of prior year's budget
- Justification for significant increases
- Alignment with BDP 2023-2028 priorities
- Personnel complement vs. filled positions
- Status of prior year's unfunded programs
- Capital outlay implementation readiness
- Revenue generation targets (if applicable)

For each question, note: the specific budget item it targets and the expecte
d response format.
```

*Expected output:* Numbered list of 10 questions with budget item references. *Quality check:* Confirm each question references an actual line item in the budget proposal.

### Prompt A.2.3 — COA Finding Response Drafter

*Task:* Draft management responses to audit observations.

```
You are an accountant preparing management comments for COA audit
observations.

For each audit observation below, draft a management response that:
1. Acknowledges the finding (do not be defensive)
2. Explains the context (why the situation occurred)
3. States the corrective action taken or planned
4. Provides the timeline for completion
5. Names the responsible officer

Observation: [PASTE COA OBSERVATION]

Write in formal but clear language. Each response should be 100-200 words.
```

*Expected output:* Structured management response per observation. *Quality check:* Ensure corrective actions are specific and have realistic timelines. Have the accountant verify technical accuracy.

### Prompt A.2.4 — Obligation and Disbursement Tracker Summary

*Task:* Summarize financial performance for a quarterly report.

```
Analyze the following obligation and disbursement data for [OFFICE NAME],
Q[QUARTER] FY [YEAR]:

[PASTE DATA: allotment, obligations, disbursements by expense class]

Provide:
1. Obligation rate by expense class (PS, MOOE, CO) and total
2. Disbursement rate by expense class and total
3. Comparison to same quarter previous year (if data provided)
4. Programs with lowest obligation rates and potential causes
5. Recommendations to improve utilization before year-end

Format as a dashboard summary: table first, then 3-5 bullet points of key fi
ndings.
```

*Expected output:* Financial dashboard summary. *Quality check:* Recalculate rates manually for the three largest line items.

### Prompt A.2.5 — Annual Procurement Plan AI Review

*Task:* Check an APP for completeness and compliance.

```
Review the following Annual Procurement Plan for compliance with:
- RA 9184 (Government Procurement Reform Act) requirements
- BAA 84 (Bangsamoro Budget System Act) provisions on procurement planning
- DBM-GPPB Joint Circular guidelines

Check for:
1. Completeness of required columns (PMO, mode of procurement, schedule,
ABC)
2. Procurement modes selected — are they appropriate for the ABC amounts?
3. Items that may require early procurement action based on lead times
4. Any items that appear to duplicate existing contracts
5. Total ABC vs. approved budget — is the APP within budget limits?

[PASTE APP DATA OR KEY SECTIONS]
```

*Expected output:* Compliance review with specific findings. *Quality check:* Verify procurement thresholds against current RA 9184 IRR schedules.

### Prompt A.2.6 — Budget Brief Talking Points

*Task:* Prepare talking points for a budget presentation to Parliament.

```
Prepare budget presentation talking points for [MINISTRY NAME] FY [YEAR]
budget defense before the Committee on Appropriations.

Key data:
- Total proposed budget: [AMOUNT]
- Key programs: [LIST TOP 5]
- Major changes from prior year: [SUMMARY]

Structure as:
1. Opening statement (2-3 sentences): mandate, key achievement, budget reque
st
2. Priority programs (3-5 bullets each): what it does, who benefits, budget
amount, expected output
3. Anticipated questions and prepared responses (5 items)
4. Closing appeal (2-3 sentences)

Keep total under 800 words. Use specific numbers, not vague claims.
```

*Expected output:* Structured talking points document. *Quality check:* Verify all budget figures match the official proposal. Remove any claim not supported by actual data.

---

## A.3 Legislative and Policy Prompts

### Prompt A.3.1 — Policy Landscape Scan

*Task:* Map existing laws relevant to a proposed bill.

```
You are a legislative researcher for the Bangsamoro Parliament.

I am preparing a bill on [TOPIC]. Scan the following list of enacted Bangsam
oro Autonomy Acts and identify every BAA that:
1. Directly addresses this topic
2. Contains provisions that may overlap or conflict
3. Establishes agencies, commissions, or offices with related mandates
4. Defines terms that this bill must adopt or reconcile

Also identify relevant national laws (Republic Acts) that apply to the same
subject matter.

Present findings as a table: Law, Key Provisions, Relationship to Proposed B
ill (supports/conflicts/supplements).

[PASTE BAA LIST OR PROVIDE TOPIC DETAILS]
```

*Expected output:* Legal landscape matrix. *Quality check:* Verify every BAA number and title cited. Cross-check against the official BAA index.

### Prompt A.3.2 — Explanatory Note Drafter

*Task:* Draft an explanatory note for a filed bill.

```
You are a legislative staff member of the Bangsamoro Parliament.

Draft an explanatory note for [BILL TITLE/NUMBER] following this structure:
1. Context and rationale — what problem does this bill address?
2. Legal basis — BOL provisions, national laws, and existing BAAs that autho
rize this legislation
3. Objectives — what the bill aims to achieve
4. Key features — summary of major provisions (numbered)
5. Fiscal impact — estimated cost and funding source
6. Expected beneficiaries — who benefits and how

Background information:
[PASTE POLICY BRIEF, RESEARCH NOTES, OR BILL SUMMARY]

Write in formal legislative language. Keep under 1,500 words.
```

*Expected output:* Complete explanatory note draft. *Quality check:* Verify every BOL article and BAA cited. Confirm the bill's provisions match the explanatory note's claims.

### Prompt A.3.3 — Interpellation Question Tree

*Task:* Prepare questions for interpellation of a bill sponsor.

```
You are a legislative researcher preparing interpellation material for [MP
NAME], who will question the sponsor of [BILL TITLE/NUMBER].

Generate a question tree with:
1. Opening questions (scope and intent) — 3 questions
2. Technical questions (specific provisions) — 5 questions
3. Fiscal questions (budget and funding) — 3 questions
4. Implementation questions (who, when, how) — 3 questions
5. Follow-up branches: for each question, provide one follow-up if the spons
or answers "yes" and one if they answer "no"

Base questions on: [PASTE BILL SUMMARY OR KEY PROVISIONS]

Write questions in parliamentary language. Each question should target a spe
cific section or provision.
```

*Expected output:* Branching question tree with 14+ questions. *Quality check:* Ensure each question references a real provision in the bill.

### Prompt A.3.4 — Committee Report Structure

*Task:* Draft the structure and key sections of a committee report.

```
Draft a committee report for [BILL TITLE/NUMBER] as reviewed by the
Committee on [COMMITTEE NAME].

Include:
1. Background and referral history
2. Summary of committee hearings (dates, resource persons, key testimony)
3. Key issues raised during deliberations
4. Committee amendments (if any) with justification
5. Committee recommendation (approval, approval with amendments, or further
study)

Source information:
[PASTE HEARING NOTES, TESTIMONY SUMMARIES, OR COMMITTEE DISCUSSION POINTS]

Follow the format prescribed by the BTA Rules of Procedure and the Bill Draf
ting Guidebook.
```

*Expected output:* Committee report draft. *Quality check:* Verify hearing dates and resource person names against actual records.

### Prompt A.3.5 — Policy Recommendation Memo

*Task:* Draft a policy recommendation for executive action.

```
Draft a policy recommendation memo for [DECISION-MAKER TITLE AND NAME].

Subject: [POLICY ISSUE]

Structure:
1. Issue statement (1 paragraph)
2. Background and context (2-3 paragraphs)
3. Options analysis (3 options minimum):
   - Description of each option
   - Pros and cons
   - Fiscal implications
   - Legal considerations
   - Implementation feasibility
4. Recommended option with justification
5. Proposed next steps with timeline

Base the analysis on: [PASTE RESEARCH DATA, STAKEHOLDER INPUT, OR PRIOR MEMO
S]
```

*Expected output:* Decision-ready policy memo. *Quality check:* Ensure the recommended option is genuinely the strongest, not just the first one listed. Verify fiscal figures.

### Prompt A.3.6 — Amendment Language Drafter

*Task:* Draft specific amendment text for a bill under deliberation.

```
Draft amendment language for [BILL TITLE/NUMBER].

Amendment target: Section [NUMBER], which currently reads:
"[PASTE CURRENT TEXT]"

Proposed change: [DESCRIBE WHAT THE AMENDMENT SHOULD DO]

Provide:
1. The amended text (showing deletions in strikethrough and additions in bol
d, or using "DELETE... INSERT..." format)
2. Brief justification (2-3 sentences)
3. Impact on other sections of the bill (cross-reference check)
4. Potential objections the sponsor may raise

Use formal legislative drafting conventions per the Bill Drafting Guidebook.
```

*Expected output:* Amendment text with justification and impact analysis. *Quality check:* Verify the current text matches the actual bill. Check that the amendment does not create internal contradictions.

### Prompt A.3.7 — IRR Framework Generator

*Task:* Create the skeletal framework for implementing rules and regulations.

```
Generate an IRR framework for [BAA NUMBER AND TITLE].

For each section of the law that requires implementing rules, provide:
1. The BAA section requiring IRR provisions
2. What the IRR must specify (rules, procedures, standards, timelines)
3. Which agency or office should lead drafting
4. Stakeholders who should be consulted
5. Timeline recommendation

Organize by chapter/article of the BAA. Flag any provisions that are self-ex
ecuting and do not require IRR.

[PASTE BAA TEXT OR SUMMARY]
```

*Expected output:* IRR development roadmap table. *Quality check:* Verify every section reference against the actual BAA. Confirm the implementing agencies exist.

---

## A.4 Administrative and Correspondence Prompts

### Prompt A.4.1 — Executive Order Drafter

*Task:* Draft an executive order or administrative order.

```
Draft an [Executive Order / Administrative Order] for [ISSUING AUTHORITY].

Subject: [TOPIC]
Purpose: [WHAT IT ESTABLISHES, DIRECTS, OR AUTHORIZES]
Legal basis: [ENABLING LAW OR AUTHORITY]

Structure per standard BARMM format:
1. WHEREAS clauses (3-5, establishing context and authority)
2. NOW, THEREFORE clause
3. Numbered sections (purpose, scope, definition of terms, substantive provi
sions, effectivity)
4. Signature block with title and date

Substantive content: [PASTE YOUR NOTES OR POLICY DECISIONS]
```

*Expected output:* Complete EO/AO draft. *Quality check:* Verify the legal basis is valid. Confirm the issuing authority has jurisdiction.

### Prompt A.4.2 — Official Correspondence Drafter

*Task:* Draft a formal letter from a BARMM official.

```
Draft an official letter from [SENDER NAME, TITLE, OFFICE] to [RECIPIENT
NAME, TITLE, OFFICE].

Purpose: [REQUEST/ENDORSEMENT/REPLY/TRANSMITTAL/INVITATION]

Key points to cover:
[LIST THE SUBSTANTIVE CONTENT]

Requirements:
- Formal Philippine government correspondence format
- Opening salutation appropriate to the recipient's rank
- Clear action requested or information conveyed
- Appropriate closing and complimentary close
- Reference number placeholder: [REF NO.]

Keep under 400 words. Direct and respectful tone.
```

*Expected output:* Formal letter draft. *Quality check:* Verify recipient's correct title and office name. Ensure the action requested is clear.

### Prompt A.4.3 — Meeting Minutes Organizer

*Task:* Convert raw meeting notes into structured minutes.

```
Convert the following raw meeting notes into formal minutes:

[PASTE RAW NOTES]

Format:
1. Header: meeting title, date, time, venue, presiding officer
2. Attendees (with titles and offices)
3. Agenda items (numbered)
4. For each agenda item: summary of discussion, decisions made, action
items (who, what, when)
5. Next meeting date
6. Prepared by / Noted by lines

Write in past tense, third person. Attribute decisions to the body, not indi
viduals, unless a specific directive was given.
```

*Expected output:* Formatted meeting minutes. *Quality check:* Verify attendee names and titles. Confirm action items have specific responsible persons and deadlines.

### Prompt A.4.4 — Travel/Activity Report

*Task:* Draft a post-activity report from field notes.

```
Draft an activity report based on the following field notes:

Activity: [NAME]
Date(s): [DATES]
Venue: [LOCATION]
Participants: [NUMBER AND TYPE]
Conducted by: [OFFICE/TEAM]

Raw notes:
[PASTE YOUR NOTES]

Structure:
1. Activity overview (1 paragraph)
2. Objectives
3. Proceedings/Activities conducted (chronological)
4. Key findings or outputs
5. Issues and challenges encountered
6. Recommendations
7. Annexes list (attendance sheet, photos, handouts)
```

*Expected output:* Complete activity report. *Quality check:* Verify dates, participant counts, and venue names.

### Prompt A.4.5 — Memorandum of Agreement Framework

*Task:* Draft a framework MOA between two BARMM entities.

```
Draft a MOA between [PARTY A — name, office, represented by] and [PARTY B —
name, office, represented by].
Purpose: [WHAT THE MOA ESTABLISHES]. Duration: [PERIOD].

Include: WHEREAS clauses, purpose, scope, responsibilities of each party, fi
nancial arrangements, confidentiality, amendment/termination, dispute resolu
tion, effectivity, signature blocks.

Key terms: [PASTE KEY TERMS AND RESPONSIBILITIES]
```

*Expected output:* MOA framework draft. *Quality check:* Verify both parties have authority to enter the agreement. Ensure financial terms are specific.

## A.5 Research and Reporting Prompts

### Prompt A.5.1 — Literature Review Synthesizer

*Task:* Synthesize multiple sources into a structured review.

```
Synthesize the following sources into a literature review on [TOPIC]:

[PASTE SUMMARIES, EXCERPTS, OR SOURCE LIST]

Structure:
1. Overview of the research landscape (what has been studied, what gaps exis
t)
2. Key themes across sources (organize by theme, not by source)
3. Points of agreement across sources
4. Points of disagreement or debate
5. Implications for BARMM policy/governance
6. Research gaps that future work should address

Cite sources using [Author, Year] format. Keep to 1,500–2,000 words.
```

*Expected output:* Thematic literature review. *Quality check:* Verify that claims attributed to specific sources actually appear in those sources.

### Prompt A.5.2 — Annual Report Section Drafter

*Task:* Draft a section of an office annual report from raw data.

```
Draft the [SECTION NAME] section of the FY [YEAR] Annual Report for [OFFICE
NAME].

Data provided:
[PASTE KEY ACCOMPLISHMENTS, STATISTICS, NARRATIVES]

Structure:
1. Overview (2–3 sentences summarizing the year's performance)
2. Major accomplishments (bulleted, with specific numbers)
3. Key performance indicators achieved vs. targets (table format)
4. Challenges encountered
5. Plans for the coming year

Tone: factual, achievement-oriented, but honest about challenges. Write in p
ast tense.
Use specific numbers and percentages, not vague qualifiers.
```

*Expected output:* Annual report section draft. *Quality check:* Verify every number against source data. Remove any unsupported superlatives.

### Prompt A.5.3 — Position Paper Drafter

*Task:* Draft an office position paper on a policy issue.

```
Draft a position paper for [OFFICE NAME] on [POLICY ISSUE].

Office position: [SUMMARIZE THE OFFICE'S STANCE]

Structure:
1. Executive summary (200 words)
2. Background and context
3. Analysis of the issue (including stakeholder perspectives)
4. Office position and rationale
5. Supporting evidence
6. Recommendations
7. Conclusion

Sources and evidence: [PASTE RELEVANT DATA, LEGAL REFERENCES, PRECEDENTS]

Write in formal analytical tone. 2,000–2,500 words.
```

*Expected output:* Position paper draft. *Quality check:* Ensure the position is internally consistent. Verify all legal citations.

### Prompt A.5.4 — Comparative Analysis Table Builder

*Task:* Build a comparison matrix across jurisdictions or programs.

```
Build a comparative analysis table for [TOPIC] across the following
[jurisdictions/programs/offices]:
[LIST 3–5 ITEMS TO COMPARE]

Comparison dimensions:
[LIST 5–8 CRITERIA]

For each cell, provide: the specific practice or provision (not a vague summ
ary), and note the source. Add a final row: "Key Takeaway for BARMM" — what
BARMM can adopt or adapt from each.
```

*Expected output:* Structured comparison matrix. *Quality check:* Verify each cell's content against the actual source.

---

## A.6 M&E and Oversight Prompts

### Prompt A.6.1 — KPI Dashboard Builder

*Task:* Create a performance monitoring dashboard from raw data.

```
Create a KPI dashboard for [OFFICE/PROGRAM NAME] based on the following
data:

[PASTE PERFORMANCE DATA: targets, actual accomplishments, timelines]

For each KPI:
1. KPI name and definition
2. Target value
3. Actual value
4. Achievement rate (%)
5. Status: On Track (≥80%), At Risk (50-79%), Off Track (<50%)
6. Brief explanation for any Off Track or At Risk items

Present as a table. Then provide a 3-sentence executive summary
highlighting: best performing KPI, worst performing KPI, and overall
program health.
```

*Expected output:* KPI dashboard table with executive summary. *Quality check:* Recalculate achievement rates manually for the top 3 items.

### Prompt A.6.2 — Program Evaluation Framework

*Task:* Design an evaluation framework for a BARMM program.

```
Design an evaluation framework for [PROGRAM NAME].

Program details:
- Duration: [START-END]
- Budget: [AMOUNT]
- Beneficiaries: [WHO AND HOW MANY]
- Key activities: [LIST]
- Expected outcomes: [LIST]

Include:
1. Evaluation questions (5-7, covering relevance, efficiency,
effectiveness, impact, sustainability)
2. For each question: indicators, data sources, data collection methods, ana
lysis approach
3. Evaluation timeline (when to conduct midterm vs. endline)
4. Stakeholder participation in the evaluation
5. Ethical considerations
6. Suggested evaluation team composition
```

*Expected output:* Evaluation framework document. *Quality check:* Ensure evaluation questions are answerable with available data. Confirm timeline is realistic.

### Prompt A.6.3 — COA Compliance Self-Assessment

*Task:* Prepare a self-assessment against common COA findings.

```
Conduct a self-assessment for [OFFICE NAME] against the most common COA
audit findings in BARMM:

Common finding categories:
1. Cash advances not liquidated within prescribed period
2. Procurement not following RA 9184 procedures
3. Fund utilization below 80% of allotment
4. Incomplete or missing supporting documents
5. Non-compliance with DBM budget execution guidelines
6. Payroll discrepancies
7. Property and inventory management gaps

For each category, help me document:
- Current office status (compliant/partially compliant/non-compliant)
- Evidence of compliance (what records exist)
- Gaps identified
- Corrective actions needed
- Timeline for corrective action
```

*Expected output:* Self-assessment checklist with corrective action plan. *Quality check:* Each compliance claim must be supported by documentary evidence.

### Prompt A.6.4 — Oversight Analysis of Agency Performance

*Task:* Analyze an agency's performance report for parliamentary oversight.

```
You are a legislative researcher analyzing [AGENCY NAME]'s performance for
the Committee on [COMMITTEE NAME].

Performance data: [PASTE ANNUAL REPORT DATA OR KPIs]
Budget data: [PASTE BUDGET VS. UTILIZATION]

Analyze:
1. Overall mandate fulfillment: is the agency doing what its enabling law re
quires?
2. Budget utilization: how effectively is the budget being spent?
3. Output delivery: are committed outputs being delivered on time?
4. Gaps between legislative intent and actual implementation
5. Red flags: any patterns suggesting systemic problems

Generate 5 oversight questions for the committee chair to ask the agency hea
d.
```

*Expected output:* Oversight analysis brief with questions. *Quality check:* Verify budget figures. Confirm the agency's enabling law is correctly cited.

### Prompt A.6.5 — Quarterly Monitoring Report Template

*Task:* Generate a standardized quarterly monitoring report.

```
Generate a quarterly monitoring report for [PROGRAM/PROJECT NAME],
Q[QUARTER] FY [YEAR].

Data:
[PASTE: physical targets vs. accomplishments, financial data, timeline
status]

Structure:
1. Executive summary (5 sentences)
2. Physical performance (table: target, actual, %, variance explanation)
3. Financial performance (table: allotment, obligation, disbursement, rates)
4. Implementation issues and bottlenecks
5. Corrective actions taken
6. Outlook for next quarter
7. Recommendations
```

*Expected output:* Complete quarterly monitoring report. *Quality check:* Verify all percentages by manual calculation. Confirm physical targets match the approved work plan.

---

# Appendix B — Tool Setup Guides

These guides get you from zero to productive in one sitting. Each covers one tool. Screenshots will vary as interfaces update, but the logic stays the same.

---

## B.1 Claude (Web and Desktop)

**Getting started:**

1. **Create an account.** Go to claude.ai. Sign up with your email address. The free tier gives you access to conversational AI. Claude Pro (paid) gives higher usage limits and access to more capable models.
2. **Your first government prompt.** Once logged in, you see a text box. Type a task from Appendix A — start with Prompt A.4.2 (Official Correspondence). Replace the bracketed items with real information. Press Enter. Read the output. Edit it. Send a follow-up prompt asking for changes. You have just completed the four-step workflow from Chapter 3.
3. **Set up a Project.** Claude Projects let you create a persistent workspace with custom instructions and uploaded reference documents.
4. Click "Projects" in the sidebar
5. Create a new project named after your office or function (e.g., "Committee on Appropriations" or "MFBM Budget Division")
6. In Project Instructions, paste a role description: "You are a [role] for [office]. You follow BARMM procedures and reference Philippine laws."
7. Upload key reference documents: your office's mandate (from the enabling BAA), the BDP summary, your office SOP, or any recurring reference you use daily
8. Every conversation within this project will have access to those instructions and documents automatically
9. **Desktop app.** Download Claude Desktop from the Anthropic website. It works the same as the web version but runs as a standalone application. Use it when you want AI assistance while working in other applications.

**Key habits:** Start with a clear task. Provide context. Review every output. Save prompts that work well.

## B.2 NotebookLM

**Getting started:**

1. **Access NotebookLM.** Go to notebooklm.google.com. Sign in with your Google account. NotebookLM is free.
2. **Create your first notebook.** Click "New Notebook." Name it after the project or topic (e.g., "BAA 85 Budget Analysis" or "Committee on Education Hearing Prep").
3. **Add sources.** Click "Add Source." You can upload:
4. PDFs (legislative texts, committee reports, audit findings)
5. Google Docs
6. Google Slides
7. Web URLs
8. Pasted text

Upload 2-5 sources to start. NotebookLM reads and indexes them automatically.

1. **Ask questions.** In the chat panel, ask questions about your sources. NotebookLM answers with citations pointing to specific passages in your uploaded documents. This is the key advantage: every claim is traceable to a source you provided.
2. **Generate outputs.** Use the notebook guide features to:
3. Generate a summary of all sources
4. Create an FAQ from the documents
5. Build a study guide or briefing document
6. Generate an audio discussion (useful for reviewing material while commuting)

**For government use:** Create one notebook per legislative measure, budget review, or oversight inquiry. Upload all relevant documents into that notebook. Use it as your research assistant during deliberations.

## B.3 Obsidian as a Government Knowledge Base

**Getting started:**

1. **Install Obsidian.** Download from obsidian.md. It is free for personal use. Obsidian runs locally on your computer — your files never leave your device unless you choose to sync them.
2. **Create a vault.** A vault is a folder on your computer. Create one named after your office (e.g., "BARMM-Budget-Division"). Obsidian will manage everything inside it.
3. **Structure for government use.** Create these top-level folders:

`/reference/ — Laws, policies, standing documents /projects/ — One subfolder per active project or measure /meetings/ — Meeting notes /templates/ — Reusable templates (briefers, memos, reports) /ai-outputs/ — Saved AI-generated drafts for review /archive/ — Completed projects (move, don't delete)`

1. **Link your notes.** Obsidian's strength is linking. When you mention a BAA in a meeting note, type `[[BAA 84]]` to create a link to your reference note on that law. Over time, these links create a web of institutional knowledge.
2. **Use with AI.** When preparing a prompt for Claude or NotebookLM, open the relevant Obsidian notes and copy the context you need. When AI produces a useful output, save it in your vault under the relevant project folder. Your vault becomes the institutional memory that survives staff turnover.

**Key principle:** Write notes in your own words. Link them to each other. Review them before meetings. Your vault compounds in value over time.

---

# Appendix C — AI Readiness Assessment Checklist

Use this checklist to assess your office's readiness for AI adoption. Score each item: **Yes = 1 point**, **No = 0 points**. Total your score at the end.

*Instruction:* Have 2-3 staff members complete this independently, then compare scores. Discrepancies reveal areas where readiness varies within the office.

---

## Infrastructure (5 items)

| # | Item | Yes | No |
|---|---|---|---|
| 1 | Staff have individual computers or laptops with internet access | ☐ | ☐ |
| 2 | Internet speed is sufficient for web-based tools (can load websites and stream video) | ☐ | ☐ |
| 3 | Staff have access to personal or office email accounts (needed for AI tool registration) | ☐ | ☐ |
| 4 | The office has a file storage system (shared drive, Google Drive, or local server) | ☐ | ☐ |
| 5 | Staff can install software on their computers or have IT support to do so | ☐ | ☐ |

**Infrastructure subtotal: ___ / 5**

## Staff Skills (5 items)

| # | Item | Yes | No |
|---|---|---|---|
| 6 | Most staff can type at a functional speed (can compose a 200-word email in under 10 minutes) | ☐ | ☐ |
| 7 | At least one staff member has used an AI tool (Claude, ChatGPT, Gemini, or similar) | ☐ | ☐ |
| 8 | Staff regularly use digital tools for work (email, spreadsheets, word processing) | ☐ | ☐ |
| 9 | Staff are comfortable learning new software with guidance | ☐ | ☐ |
| 10 | At least one staff member can serve as a peer trainer for new digital tools | ☐ | ☐ |

**Staff Skills subtotal: ___ / 5**

## Document Organization (5 items)

| # | Item | Yes | No |
|---|---|---|---|
| 11 | Key reference documents (enabling laws, SOPs, plans) exist in digital format | ☐ | ☐ |

| # | Item | Yes | No |
|---|---|---|---|
| 12 | Documents are organized in a consistent folder structure | ☐ | ☐ |
| 13 | The office maintains soft copies of its outputs (reports, briefers, memos) | ☐ | ☐ |
| 14 | Historical documents from the past 2+ years are retrievable | ☐ | ☐ |
| 15 | Document naming follows a consistent convention (or could be standardized quickly) | ☐ | ☐ |

**Document Organization subtotal: ___ / 5**

## Policy Framework (5 items)

| # | Item | Yes | No |
|---|---|---|---|
| 16 | The office has a data privacy awareness (even informal) — staff know not to share confidential data publicly | ☐ | ☐ |
| 17 | The office has documented standard operating procedures for major functions | ☐ | ☐ |
| 18 | There is a quality review process for official documents | ☐ | ☐ |

| # | Item | Yes | No |
|---|---|---|---|
| | (at least one reviewer before release) | | |
| 19 | The office has or can quickly draft guidelines for new technology use | ☐ | ☐ |
| 20 | Records management policies exist (even basic rules for filing and retention) | ☐ | ☐ |

**Policy Framework subtotal: ___ / 5**

## Leadership Support (5 items)

| # | Item | Yes | No |
|---|---|---|---|
| 21 | The office head is aware of AI tools and their potential for government work | ☐ | ☐ |
| 22 | The office head would support staff experimenting with AI for work tasks | ☐ | ☐ |
| 23 | Budget exists (or can be reallocated) for tool subscriptions (even small amounts) | ☐ | ☐ |
| 24 | The office culture allows trying new approaches (not strictly "this is how we've always done it") | ☐ | ☐ |

| # | Item | Yes | No |
|---|---|---|---|
| 25 | A champion — someone willing to lead the AI adoption effort — can be identified | ☐ | ☐ |

**Leadership Support subtotal: ___ / 5**

## Scoring Rubric

| Score | Readiness Level | What It Means | Next Step |
|---|---|---|---|
| **20-25** | Ready | Your office has the foundation. Begin with Chapter 13's 90-day plan. | Start Appendix H immediately |
| **15-19** | Almost Ready | Most elements are in place. Address the gaps first. | Fix 0-score categories, then start Chapter 13 |
| **10-14** | Needs Work | Several foundations are missing. Focus on prerequisites. | Address Infrastructure and Document Organization first |
| **Below 10** | Start with Foundations | The office needs basic digital readiness before AI adoption. | Begin with Chapter 2 for literacy, build infrastructure |

# Appendix D — Sample AI Policy for a BARMM Office

> *This is a model policy template. Replace all bracketed items with your office's specifics. Adapt sections to your context. Have your legal officer review before issuance.*

---

**[OFFICE NAME]**

**Administrative Order No. [NUMBER] Series of [YEAR]**

**SUBJECT: POLICY ON THE USE OF ARTIFICIAL INTELLIGENCE TOOLS IN [OFFICE NAME] OPERATIONS**

---

**WHEREAS**, the Bangsamoro government is committed to improving public service delivery and administrative efficiency through responsible adoption of technology;

**WHEREAS**, artificial intelligence tools have demonstrated the capacity to assist government staff in research, drafting, analysis, and reporting functions;

**WHEREAS**, the responsible use of such tools requires clear guidelines to protect data privacy, ensure output quality, and maintain public trust;

**WHEREAS**, Republic Act No. 10173 (Data Privacy Act of 2012) and its Implementing Rules and Regulations establish requirements for the protection of personal and sensitive information;

**NOW, THEREFORE**, the following policy is hereby adopted:

---

## Section 1. Purpose

This policy establishes guidelines for the responsible use of artificial intelligence (AI) tools by personnel of [OFFICE NAME] in the performance of their official functions.

## Section 2. Scope

This policy applies to all personnel of [OFFICE NAME], including regular, contractual, casual, and job order employees who use AI tools for work-related tasks, whether on office equipment or personal devices.

## Section 3. Definition of Terms

- **AI Tool** — Any software application that uses artificial intelligence to generate, analyze, summarize, translate, or otherwise process text, data, or images. This includes but is not limited to Claude, ChatGPT, Gemini, NotebookLM, and similar platforms.
- **AI-Assisted Output** — Any document, analysis, draft, or report produced in whole or in part with the assistance of an AI tool.
- **Confidential Information** — Information classified as confidential, restricted, or sensitive under existing BARMM information classification guidelines, including personal data of individuals, pre-decisional policy documents, and security-related information.

## Section 4. Authorized Uses

Personnel may use AI tools for the following purposes: 1. Drafting correspondence, reports, briefers, and other documents 2. Summarizing and analyzing publicly available laws, policies, and reports 3. Conducting research and literature reviews 4. Preparing presentation materials and talking points 5. Translating documents between English, Filipino, and Arabic 6. Organizing and structuring data for analysis 7. Generating templates for routine office processes 8. Proofreading and improving drafted documents

## Section 5. Prohibited Uses

Personnel shall NOT use AI tools for the following: 1. Uploading confidential, classified, or sensitive government information to cloud-based AI tools 2. Uploading personal data of citizens, employees, or officials to AI tools without data privacy compliance 3. Submitting AI-generated outputs as final documents without human review and approval 4. Making official decisions or commitments based solely on AI recommendations 5. Using AI tools for personal, commercial, or political purposes on government time or equipment 6. Generating false information, fake documents, or misleading content 7. Bypassing established review and approval workflows

## Section 6. Quality Assurance Requirements

All AI-assisted outputs shall undergo the following quality assurance process before submission or publication: 1. **Factual verification** — Every factual claim, statistic, legal reference, and name in the output must be verified against primary sources 2. **Legal review** — Any output citing laws, BAAs, or regulations must have citations verified against the actual legal text 3. **Supervisor review** — AI-assisted outputs must pass through the standard document review chain before release 4. **Bias check** — Outputs must be reviewed for bias, culturally inappropriate content, and assumptions that do not apply to the Bangsamoro context

## Section 7. Data Privacy Compliance

1. Personnel shall classify information before inputting it into any AI tool using the office's information classification guide.
2. Personal data as defined under RA 10173 shall not be uploaded to AI tools unless the tool provides enterprise-grade data protection and a processing agreement is in place.
3. When in doubt about whether information can be shared with an AI tool, personnel shall consult the office Data Protection Officer or immediate supervisor.

## Section 8. Attribution and Disclosure

1. AI-assisted outputs shall be disclosed as such when submitted for review. A simple notation is sufficient: "This draft was prepared with AI assistance and has been reviewed for accuracy."
2. Final published documents do not require AI disclosure unless the office head determines it appropriate.
3. Personnel shall not represent AI-generated work as entirely their own in contexts where authorship matters (e.g., academic papers, official certifications, sworn statements).

## Section 9. Training Requirements

1. All personnel who use AI tools shall complete the office AI literacy orientation within [30/60/90] days of this policy's effectivity.
2. The orientation shall cover: basic prompting, quality assurance procedures, data privacy guidelines, and prohibited uses.
3. The [designated unit/AI Champion] shall conduct refresher training at least once annually.

4. Completion of AI training shall be documented and included in individual training records.

## Section 10. Review and Amendment

1. This policy shall be reviewed [annually / semi-annually] by [designated unit/officer].
2. Amendments may be proposed by any personnel and shall be reviewed by [designated body].
3. Significant changes in AI technology or government policy shall trigger an off-cycle review.

## Section 11. Effectivity

This Administrative Order shall take effect immediately upon signing.

Issued this ___ day of ____, [YEAR], at [LOCATION].

---

**[NAME OF AUTHORIZING OFFICIAL]** [Title]

---

# Appendix E — AI-Assisted CSW: ADDRESS IT with AI at Every Step

The ADDRESS IT methodology is BARMM's seven-step framework for Complete Staff Work.[^1] This appendix maps AI assistance to each step, showing what AI can do, what it cannot, and how to prompt it. For the full ADDRESS IT methodology, refer to the *Complete Staff Work Guidebook for BARMM*.[^2]

---

## E.1 Analyze Context with AI

**The step:** Understand the situation, identify the trigger, gather background information, determine who is involved and affected.

**What AI can do:** - Summarize background documents (prior memos, committee reports, audit findings) - Identify stakeholders from legal mandates and organizational charts - Map the regulatory landscape (which laws, policies, and plans are relevant) - Generate a structured situational analysis from raw notes

**What AI cannot do:** - Assess the political sensitivity of the situation - Judge the urgency from an organizational perspective - Know internal office dynamics, informal power structures, or unwritten priorities - Replace conversation with the supervisor who assigned the task

**Sample prompt:**

```
I am preparing a CSW document. Help me analyze the context.

Trigger: [WHAT INITIATED THIS TASK — directive, inquiry, problem, opportunit
y]
Background: [PASTE AVAILABLE INFORMATION — memos, reports, data]
Decision-maker: [WHO WILL ACT ON THIS CSW]

Provide:
1. Situation summary (3–5 sentences)
2. Key stakeholders and their interests
3. Relevant laws and policies (BOL, BAAs, national laws)
4. Information gaps — what do I still need to find out?
5. Suggested scope boundaries — what should this CSW cover and NOT cover?
```

**Quality check:** Does the AI's situational summary match your understanding? Are the stakeholders complete? Did you add the stakeholders and dynamics the AI would not know about?

---

## E.2 Define/Deliberate the Problem with AI

**The step:** Frame the problem precisely. Distinguish the root cause from symptoms. Define what a successful resolution looks like.

**What AI can do:** - Help frame a problem statement from scattered symptoms - Apply problem analysis frameworks (5 Whys, fishbone diagram, problem tree) - Identify whether the problem is technical, political, legal, or operational - Draft clear problem statements in CSW-appropriate language

**What AI cannot do:** - Determine the "real" problem when political considerations obscure it - Replace the judgment call about which framing the decision-maker will accept - Know whether this problem has been raised and rejected before

**Sample prompt:**

```
Help me define the problem for a CSW document.

Symptoms observed: [LIST WHAT IS GOING WRONG]
Context: [BRIEF BACKGROUND FROM E.1]
Decision-maker: [WHO]

Apply the 5 Whys technique to move from symptoms to root causes.
Then draft a problem statement in this format:
"The [specific problem] is causing [specific harm] to [specific
stakeholders], resulting in [measurable impact]."

Provide 2-3 alternative problem framings so I can choose the most accurate o
ne.
```

**Quality check:** Does the problem statement describe a problem the decision-maker can actually act on? Is it specific enough to guide the analysis?

---

## E.3 Research with AI

**The step:** Gather evidence, legal references, precedents, data, and expert perspectives relevant to the problem.

**What AI can do:** - Search and summarize legal provisions (BOL, BAAs, national laws) - Compile comparative data from uploaded documents - Identify precedents — how was a similar problem handled before? - Organize research findings by theme or relevance - Generate annotated bibliographies from source documents

**What AI cannot do:** - Access classified or internal-only government records - Verify whether a cited precedent was actually followed or abandoned - Replace field research, stakeholder interviews, or primary data collection - Guarantee that its legal citations are complete and current

**Sample prompt:**

```
I am researching the following problem for a CSW document:
Problem: [PASTE PROBLEM STATEMENT FROM E.2]

Research the following:
1. Legal framework: What provisions of the BOL, BAAs, and national laws
   address this issue? Quote specific sections.
2. Policy context: What existing policies, plans, or directives relate
   to this issue?
3. Precedent: Has a similar issue been addressed by any BARMM office
   or comparable government entity?
4. Data: What data points or statistics are relevant?
5. Expert perspectives: What do published sources say about best
   practices for this type of issue?

For each finding, note the source and confidence level (confirmed from
primary source / inferred / needs verification).
```

**Quality check:** Every legal citation must be verified against the actual legal text. Every data point must be traced to its source. Mark anything unverified.

---

## E.4 Explore Options with AI

**The step:** Generate and analyze at least three viable options for resolving the problem.

**What AI can do:** - Generate multiple options based on research findings - Apply consistent evaluation criteria across all options - Draft pros-and-cons analysis for each option - Estimate implementation complexity and resource requirements - Identify risks associated with each option

**What AI cannot do:** - Know which option the decision-maker is inclined to accept - Assess political feasibility with the accuracy of a human insider - Guarantee cost estimates without actual budget data - Replace stakeholder consultation on option preferences

**Sample prompt:**

```
Based on the following problem and research:
Problem: [PASTE FROM E.2]
Key research findings: [PASTE FROM E.3]

Generate 3-4 viable options to address this problem. For each option:
1. Description (2-3 sentences)
2. Legal basis (what authorizes this approach)
3. Pros (3-5 points)
4. Cons (3-5 points)
5. Resource requirements (budget, personnel, time)
6. Implementation timeline
7. Risk assessment (what could go wrong)
8. Alignment with BDP 2023-2028 goals

Then provide a comparison matrix and indicate which option appears
strongest based on the analysis. Note: the final recommendation is
mine to make, not yours.
```

**Quality check:** Are the options genuinely different, or are they variations of the same approach? Is there a “do nothing” or “status quo” option for comparison? Are the pros and cons honest?

---

## E.5 Submit with AI-Assisted Quality Review

**The step:** Compile the CSW document, run quality checks, and submit through the proper channel.

**What AI can do:** - Format the CSW document according to office templates - Check internal consistency (does the recommendation match the analysis?) - Verify that all sections are complete - Proofread for grammar, clarity, and conciseness - Generate an executive summary from the full document

**What AI cannot do:** - Certify that the CSW is ready for submission (only you can do that) - Sign the document or take responsibility for its contents - Know whether the document meets the specific expectations of the decision-maker - Replace the routing and approval process

**Sample prompt:**

```
Review this CSW document for completeness and quality:

[PASTE YOUR COMPLETE CSW DRAFT]

Check for:
1. Completeness: Are all required sections present?
2. Internal consistency: Does the recommendation flow logically from
   the problem, research, and options analysis?
3. Factual accuracy: Flag any claims that lack citations or evidence
4. Clarity: Is the language clear and concise? Flag jargon or vague
   statements
5. Format: Does it follow proper CSW format?
6. Action clarity: Is the recommended action specific enough for the
   decision-maker to approve/disapprove immediately?

Provide specific, actionable feedback organized by section.
```

**Quality check:** Address every issue the AI flags. Then have a human colleague review the document independently.

---

## E.6 Sustain Implementation with AI Monitoring

**The step:** After the decision-maker approves, track implementation of the approved recommendation.

**What AI can do:** - Generate an implementation tracking template from the approved CSW - Draft implementation directives and assignment memos - Create monitoring checklists from action items - Summarize progress reports into status updates - Flag delays or deviations from the implementation timeline

**What AI cannot do:** - Monitor actual implementation (that requires physical oversight) - Hold people accountable for their assigned tasks - Detect problems not reported in documents - Replace regular check-ins with implementing units

**Sample prompt:**

```
The following CSW recommendation has been approved:
[PASTE APPROVED RECOMMENDATION AND ACTION ITEMS]

Generate:
1. Implementation plan with tasks, responsible persons, and deadlines
2. Monitoring checklist (what to verify at each milestone)
3. Status report template for weekly/monthly updates
4. Risk register for implementation risks
5. Escalation protocol — when and how to escalate if implementation
   stalls
```

**Quality check:** Does the implementation plan cover every action item in the approved recommendation? Are deadlines realistic?

---

## E.7 Iterate and Improve with AI Feedback Loops

**The step:** Evaluate outcomes, capture lessons learned, and improve the process for next time.

**What AI can do:** - Analyze implementation data against expected outcomes - Draft lessons-learned reports from post-implementation reviews - Identify process improvements for future CSW cycles - Compare current CSW quality against previous iterations - Generate recommendations for process standardization

**What AI cannot do:** - Assess whether the decision-maker is satisfied with the outcome - Know the informal feedback circulating in the office - Replace the honest self-assessment that makes iteration valuable - Determine whether the problem was truly resolved or merely addressed

**Sample prompt:**

```
The following CSW has been implemented. Evaluate the outcome:

Original problem: [PASTE]
Approved recommendation: [PASTE]
Implementation results: [PASTE ACTUAL OUTCOMES AND DATA]

Analyze:
1. Outcome vs. expectation: Was the problem resolved? Partially? Not at all?
2. Process efficiency: How long did the CSW cycle take? Where were bottlenec
ks?
3. Quality assessment: Were there factual errors, missed stakeholders, or ga
ps in the analysis?
4. Lessons learned: What would you do differently next time?
5. Recommendations: Specific process improvements for the next CSW on a simi
lar issue
```

**Quality check:** Be honest in your assessment. The value of iteration is proportional to the honesty of the evaluation.

---

# Appendix F — AI-Assisted Legislative Briefer: 13-Section Template

This template maps the 13 sections of the CSW legislative briefer format to AI assistance. Use it alongside Chapter 7 and the *Bill Drafting Guidebook*.[^3]

| # | Section | AI Contribution | Sample Prompt Starter | Human Review Focus |
|---|---|---|---|---|
| 1 | **Measure Description** | **High** — AI can summarize the bill's provisions, identify its scope, and describe key features | "Summarize [BILL NUMBER] in 300 words, covering: purpose, scope, key provisions, and implementing agency." | Verify the summary matches the actual bill text. Check for omissions. |
| 2 | **Background and Context** | **High** — AI can compile legislative history, related laws, and policy context | "Provide the legislative background for [TOPIC]: prior bills, existing BAAs, relevant national laws, and policy drivers." | Verify legislative history is complete. Add internal context the AI lacks. |
| 3 | **Legal Basis and Constitutional Framework** | **Medium** — AI can identify BOL provisions and national laws but cannot guarantee completeness | "Identify all BOL provisions, BAAs, and national laws that provide the legal basis for [BILL NUMBER]." | Verify every citation against the actual legal text. Check for missed provisions. |
| 4 | **Comparative Legislation** | **High** — AI excels at comparing provisions | "Compare [BILL NUMBER]'s approach to [TOPIC] with: | Verify foreign law citations. Assess whether comparisons |

| # | Section | AI Contribution | Sample Prompt Starter | Human Review Focus |
|---|---|---|---|---|
| | | across jurisdictions | (a) the national law, (b) ARMM precedent, (c) 2-3 international models." | are relevant to BARMM context. |
| 5 | **Stakeholder Impact Assessment** | **Medium** — AI can identify stakeholder categories but not actual stakeholder positions | "Identify all stakeholders affected by [BILL NUMBER] and analyze the likely impact on each group." | Add stakeholders the AI missed. Verify impact claims with actual stakeholder input. |
| 6 | **Fiscal Impact Analysis** | **Low** — AI can structure the analysis but cannot generate reliable cost estimates without data | "Create a fiscal impact analysis framework for [BILL NUMBER]: cost categories, revenue implications, and funding source options." | All numbers must come from MFBM or verified sources. AI structures; humans populate. |
| 7 | **Shari'ah and Islamic Values Assessment** | **Low** — AI can identify relevant principles but cannot make Shari'ah rulings | "Identify Islamic principles (Amanah, Adl, Maslahah, Shura) relevant to [BILL NUMBER] and note potential Shari'ah considerations. " | Must be reviewed by a qualified Shari'ah scholar or the Bangsamoro Darul Ifta'. |
| 8 | **Gender and Inclusivity Analysis** | **Medium** — AI can apply standard GAD frameworks | "Apply a Gender and Development lens to [BILL | Verify against actual demographic data. Consult |

| # | Section | AI Contribution | Sample Prompt Starter | Human Review Focus |
|---|---|---|---|---|
| | | but may miss BARMM-specific gender dynamics | NUMBER]: differential impact on women, men, youth, elderly, PWDs, and IPs." | with the Gender Office. |
| 9 | **Implementation Feasibility** | **Medium** — AI can identify implementation requirements but not institutional capacity | "Assess the implementation feasibility of [BILL NUMBER]: institutional requirements, timeline, capacity needs, and potential bottlenecks." | Verify institutional capacity claims with the implementing agency. |
| 10 | **Interpellation Strategy** | **High** — AI excels at generating question trees and anticipating responses | "Generate 10 interpellation questions for [BILL NUMBER], targeting: provisions, fiscal impact, implementation, and legal basis." | Ensure questions reflect the MP's actual concerns and priorities. |
| 11 | **Proposed Amendments** | **Medium** — AI can draft amendment language but cannot assess political feasibility | "Draft 3 proposed amendments to [BILL NUMBER] addressing: [SPECIFIC CONCERNS]. Include amendment text and justification." | Verify amendment text is internally consistent. Assess political feasibility. |
| 12 | | | | |

| # | Section | AI Contribution | Sample Prompt Starter | Human Review Focus |
|---|---|---|---|---|
| | **Policy Recommendation** | **Low** — AI can present options but the recommendation must be the analyst's own judgment | "Present 3 policy options for [BILL NUMBER]: approve as filed, approve with amendments, request further study. Analyze each." | The recommendation is yours. AI presents; you decide. |
| 13 | **Parliamentary Speeches** | **High** — AI can draft speeches from the analysis, but voice and conviction must be the MP's own | "Draft a 3-minute manifestation for [MP NAME] on [BILL NUMBER], [supporting/opposing] the measure, based on the following key points." | The MP must review and own every word. Edit for the MP's speaking style. |

# Appendix G — AI-Assisted Budget Briefer: BB-Coded Template

This template maps the BB-coded sections of the CSW budget briefer to AI prompts. Use alongside Chapter 6 and the *Bill Drafting Guidebook*, Chapter 9.[^4]

| Code | Section | AI Prompt | Human Review Focus |
|---|---|---|---|
| **BB01** | Budget Overview | "Summarize [MINISTRY]'s FY [YEAR] budget proposal: total amount, change from prior year, allocation by expense class (PS/MOOE/CO), and top 5 programs by allocation." | Verify all figures against the official budget document. |
| **BB02** | Mandate and Organizational Profile | "Describe [MINISTRY]'s mandate per [ENABLING BAA], organizational structure, and staffing complement. Note filled vs. vacant positions." | Verify enabling BAA citation. Confirm staffing data with HR. |
| **BB03** | Historical Budget Trend | "Analyze [MINISTRY]'s budget trends over the past 3 fiscal years: total allocation, obligation rate, disbursement rate. Identify patterns." | Verify historical figures from official GAA documents. |
| **BB04** | Variance Analysis | "Compare [MINISTRY]'s FY [YEAR] proposal to | |

| Code | Section | AI Prompt | Human Review Focus |
|---|---|---|---|
| | | FY [PRIOR YEAR] GAA. Flag all items with >15% change and explain likely reasons." | Recalculate top 5 variance items manually. |
| **BB05** | BDP Alignment Assessment | "Assess how [MINISTRY]'s proposed programs align with BDP 2023-2028 goals and strategies. Identify funded vs. unfunded BDP targets." | Verify BDP goal numbers and strategy text. |
| **BB06** | KPI Review | "Review [MINISTRY]'s proposed KPIs for FY [YEAR]. Are they SMART? Do they measure outcomes or just outputs? Suggest improvements." | Confirm KPIs are achievable with available data collection capacity. |
| **BB07** | Personnel Services Analysis | "Analyze the PS component: rate of filled positions, average salary grade, contractual vs. regular ratio, training budget adequacy." | Verify PS data against DBM-approved plantilla. |
| **BB08** | MOOE Adequacy | "Assess whether MOOE allocation is sufficient for [MINISTRY]'s operational requirements. Flag underbudgeted items." | Confirm with actual operational requirements from the ministry. |
| **BB09** | Capital Outlay Review | "Review capital outlay proposals: project descriptions, | Verify project readiness certificates and |

| Code | Section | AI Prompt | Human Review Focus |
|---|---|---|---|
| | | implementation readiness, alignment with infrastructure plan, procurement timeline." | procurement schedules. |
| **BB10** | Revenue Analysis | "Analyze [MINISTRY]'s revenue targets (if applicable): collection performance, year-over-year trend, and realism of FY [YEAR] targets." | Verify collection data against BIR/ treasury records. |
| **BB11** | COA Findings Impact | "Summarize COA audit findings for [MINISTRY] from the past 2 years. Assess whether the proposed budget addresses systemic issues flagged by auditors." | Cross-reference with actual COA Annual Audit Reports. |
| **BB12** | Scrutiny Questions | "Generate 10 scrutiny questions for [MINISTRY]'s FY [YEAR] budget, targeting: utilization, variances, KPIs, personnel, and capital outlay." | Tailor questions to specific committee concerns. |
| **BB13** | Recommendation | "Based on the analysis above, present 3 options: approve as proposed, approve with conditions, or require revision. Justify each." | The recommendation is the analyst's judgment. AI informs; the analyst decides. |

# Appendix H — 90-Day AI Adoption Plan Template

Adapt this plan for your office. Replace bracketed items. See Chapter 13, Section 13.5 for detailed guidance on each phase.

## Week-by-Week Timeline

| Week | Phase | Activity | Responsible | Deliverable | Success Indicator |
|---|---|---|---|---|---|
| 1-2 | **Foundation** | Complete AI Readiness Assessment (Appendix C); identify AI Champion; secure leadership buy-in | Office Head, AI Champion | Completed assessment scorecard; AI Champion designation memo | Assessment completed, champion identified |
| 3-4 | **Foundation** | Set up AI tools (Appendix B); create initial knowledge base; collect reference documents in digital format | AI Champion, IT support | Tool accounts created; initial vault/notebook with 10+ reference documents | All team members have tool access |
| 5-6 | **Quick Wins** | Conduct first AI training session (half-day); each staff member completes 3 practice | AI Champion | Training attendance sheet; 3 completed practice outputs per person | 80% of staff complete practice tasks |

| Week | Phase | Activity | Responsible | Deliverable | Success Indicator |
|---|---|---|---|---|---|
| | | tasks from Appendix A | | | |
| 7-8 | **Quick Wins** | Apply AI to one real routine task per staff member; begin shared prompt library | All staff, AI Champion | Prompt library document with 10+ tested prompts; one AI-assisted output per person | Prompts documented and shared |
| 9-10 | **Integration** | Draft office AI policy (Appendix D); begin team-level AI workflow for one major process | AI Champion, Office Head | Draft AI policy; one AI-integrated SOP | Policy drafted, one process integrated |
| 11-12 | **Integration** | Conduct second training session focusing on the office's specific governance function; expand knowledge base | AI Champion | Updated training materials; knowledge base with 25+ documents | Staff applying AI to function-specific tasks |
| 12-13 | **Consolidation** | Finalize and issue AI policy; document lessons learned; set 90-day review date; report | AI Champion, Office Head | Issued AI policy; lessons learned report; 90-day review memo | Policy issued, measurable improvement documented |

| Week | Phase | Activity | Responsible | Deliverable | Success Indicator |
|---|---|---|---|---|---|
| | | results to leadership | | | |

## Roles and Responsibilities

| Role | Person | Key Responsibilities |
|---|---|---|
| **Executive Sponsor** | [Office Head Name/Title] | Approve the plan, issue AI policy, allocate budget, remove institutional barriers |
| **AI Champion** | [Name/Title] | Lead implementation, conduct training, maintain knowledge base, troubleshoot issues, report progress |
| **IT Support** | [Name/Title or "IT Officer"] | Set up tool access, resolve technical issues, advise on data security |
| **Team Members** | All staff | Participate in training, practice AI tools, contribute to prompt library, report challenges |

## Milestone Checklist

- ☐ Week 2: AI Readiness Assessment completed and scored
- ☐ Week 2: AI Champion formally designated
- ☐ Week 4: All staff have AI tool accounts
- ☐ Week 4: Knowledge base created with 10+ reference documents
- ☐ Week 6: First training session completed
- ☐ Week 8: Shared prompt library has 10+ prompts
- ☐ Week 10: Draft AI policy completed
- ☐ Week 10: One major process has an AI-integrated SOP
- ☐ Week 12: Second training session completed
- ☐ Week 13: AI policy formally issued

- ☐ Week 13: Lessons learned documented
- ☐ Week 13: 90-day review date scheduled

---

# Appendix I — AI Training Workshop Design (3-Day Program)

This workshop design is ready to adapt for any BARMM office. Adjust session topics to match your office's governance function. See Chapter 14 for the pedagogical framework behind this design.

## I.1 Day 1: AI Literacy and First Prompts

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| **1.1 Opening and Context** | 8:30-9:30 | 60 min | Understand why AI matters for BARMM governance | Welcome; overview of AI in government worldwide; BARMM-specific opportunities and constraints (from Ch. 1); pre-training assessment quiz | Slide deck; pre-assessment form; printed quiz |
| **1.2 AI Foundations** | 9:45-11:15 | 90 min | Understand what AI is and how it works, in plain language | Lecture-discussion on how LLMs read, write, and reason (from Ch. 2); live demo of Claude and NotebookLM; myth-busting exercise (8 misconcept | Projector; live internet; prepared demo prompts; misconceptions handout |

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| | | | | ions from Ch. 2) | |
| **1.3 Your First Government Prompt** | 11:30-12:30 | 60 min | Write and run a first AI prompt for a government task | Guided practice: each participant writes a prompt from Appendix A (choose one matching their function); run it; review the output; identify one thing to fix | Laptops/ tablets with internet; printed Appendix A excerpts; worksheet |
| **1.4 The Four-Step Workflow** | 1:30-3:00 | 90 min | Apply the Prepare-Prompt-Review-Refine workflow to a real task | Workshop: participants bring a real document they recently worked on; re-do it using AI with the four-step workflow from Ch. 3; compare AI-assisted vs. original; group discussion on quality differences | Participants ' real documents; AI tool access; comparison worksheet |

## I.2 Day 2: AI for Your Governance Function

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| **2.1 Building Context** | 8:30-9:30 | 60 min | Learn to prepare documents for AI analysis | Hands-on: participants digitize 2-3 key reference documents; upload to NotebookLM notebook; practice asking questions about their own documents | Laptops; scanner/phone camera; Google accounts; selected office documents |
| **2.2 Function-Specific AI Application** | 9:45-11:45 | 120 min | Apply AI to the participant's specific governance function | Breakout groups by function (planning, budget, legislative, admin, M&E); each group works through 3-4 prompts from the relevant Appendix A subsection using real office data; facilitator rotates between groups | Function-specific prompt cards; real (non-confidential) office data; breakout space |
| **2.3 Quality Assurance Workshop** | 1:00-2:30 | 90 min | Learn to verify AI outputs | Exercise: facilitator provides 3 AI-generated | Pre-prepared documents with errors; answer |

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| | | | systematically | government documents with planted errors (wrong BAA numbers, incorrect budget figures, fabricated statistics); participants must find and correct all errors; debrief on verification techniques | key; verification checklist from Ch. 3 |
| **2.4 Knowledge Base Setup** | 2:45-4:00 | 75 min | Begin building a team knowledge base | Workshop: participants set up Obsidian vault (Appendix B.3) or NotebookLM notebook organized for their team; add 5-10 reference documents; practice linking notes; discuss maintenance responsibility | Obsidian installed or NotebookLM access; vault structure template; team reference documents |

## I.3 Day 3: Team Workflow Integration and Policy Drafting

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| **3.1 Team Workflow Design** | 8:30-10:00 | 90 min | Design an AI-integrated workflow for one team process | Workshop: each team selects one recurring task (e.g., weekly report, committee briefer, budget monitoring) ; maps the current process; identifies where AI enters; designs the AI-augmented version with human checkpoints; presents to the group | Process mapping template; current SOP documents; workflow design worksheet |
| **3.2 AI Policy Workshop** | 10:15-11:45 | 90 min | Draft an office AI policy | Using Appendix D as a template, teams draft their office-specific AI policy; discuss: authorized uses, prohibited uses, quality assurance, and training; facilitator guides | Printed Appendix D; policy drafting worksheet; projector for group editing |

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| | | | | discussion on contentious items | |
| **3.3 90-Day Action Planning** | 1:00-2:30 | 90 min | Create a concrete adoption plan | Using Appendix H, each team completes their 90-Day AI Adoption Plan: assign roles, set milestones, identify quick wins for Week 1; present plans to the group for peer feedback | Printed Appendix H; planning worksheet; team roster |
| **3.4 Commitment and Closing** | 2:45-4:00 | 75 min | Consolidate learning and commit to action | Post-training assessment; comparison with pre-assessment scores; each participant writes a personal AI commitment card (one thing they will do in the first week); team AI champion identified; | Post-assessment form; commitment cards; certificate templates |

| Session | Time | Duration | Objective | Activity | Materials |
|---|---|---|---|---|---|
| | | | | closing ceremony | |

# Appendix J — BARMM Legal Framework Quick Reference for AI Users

This table provides a quick reference to the laws most relevant when using AI in government work. It does not replace reading the actual legal text.

| Law | Key Provision | AI Relevance |
|---|---|---|
| **1987 Constitution, Art. III (Bill of Rights)** | Sec. 3: Privacy of communication and correspondence shall be inviolable. Sec. 7: Right of the people to information on matters of public concern. | AI tools must not compromise citizens' privacy. AI-generated analysis of government data should support — not undermine — the public's right to information. |
| **BOL (RA 11054), Art. IX (Basic Rights)** | Sec. 1-6: Right to life, liberty, equal protection, freedom of expression, privacy, and due process within BARMM. | AI-assisted government decisions must respect these rights. AI outputs used in policy-making must not introduce bias that violates equal protection. |
| **BOL (RA 11054), Art. V (Powers of Government)** | Sec. 1-3: Enumerated powers, reserved powers, and concurrent powers of the Bangsamoro Government. | AI tools assist — they do not exercise — governmental powers. Legislative and executive decisions remain with elected and appointed officials. |
| **BAA 13 (Bangsamoro Administrative Code)** | Establishes the administrative structure, procedures, and standards for BARMM offices. | AI-assisted outputs must comply with administrative procedures. Document formats, routing, and approval processes defined by the Administrative Code still apply. |
| **BAA 17 (Bangsamoro Civil Service Act)** | Establishes merit-based civil service; defines employee rights, obligations, and performance standards. | AI proficiency can be integrated into competency frameworks. AI does not replace civil servants; it augments their work. |

| Law | Key Provision | AI Relevance |
|---|---|---|
| | | Performance evaluation remains human-led. |
| **BAA 84 (Bangsamoro Budget System Act)** | Governs budget preparation, authorization, execution, and accountability. Defines budget procedures, fiscal discipline requirements. | AI assists in budget analysis, variance detection, and reporting. Budget decisions remain with authorized officials. AI outputs must align with BAA 84's procedural requirements. |
| **RA 10173 (Data Privacy Act of 2012)** | Protects personal information in government and private sector processing. Establishes rights of data subjects and obligations of data controllers/processors. | Most directly relevant law for AI use. Personal data must not be uploaded to AI tools without compliance. AI-generated profiles or analyses involving personal data require DPA compliance. |
| **RA 9184 (Government Procurement Reform Act)** | Governs procurement of goods, services, and infrastructure. Requires competitive bidding, transparency, and accountability. | AI tool subscriptions above threshold amounts must follow RA 9184 procedures. AI cannot bypass procurement requirements for government IT spending. |

**Note:** This table reflects provisions as of March 2026. Laws may be amended. Always verify against current legal text.

## Appendix K — The Author's AI Toolkit

I use AI every day in my Bangsamoro governance work. Not as a curiosity. Not as an experiment. As infrastructure. This appendix describes what I use and how, in case it helps you build your own toolkit.

**Claude Code** is my primary AI tool. It runs in a terminal and has access to my local files, which means it can read a BAA, cross-reference it against the BOL, draft a legislative briefer, and save the output to my knowledge base — all in a single workflow. Over the past year, I have built 129 custom skills (specialized instruction sets) that automate recurring governance tasks:

- **/csw** generates Complete Staff Work documents using the ADDRESS IT methodology, producing analysis-ready briefers from raw inputs.
- **/bill-drafter** produces bill text, explanatory notes, and comparative matrices following the format prescribed in the *Bill Drafting Guidebook for the Bangsamoro Parliament*.
- **/legislative-briefer** generates the 13-section legislative analysis briefer mapped in Appendix F.
- **/policy-recommendation** drafts policy memos using the Bardach Eightfold Path methodology.
- **/speech-writer** produces speeches and manifestations for parliamentary proceedings, in Tagalog, English, or Taglish, with Islamic greeting protocols.
- **/bangsamoro** serves as a domain expert — loaded with verified data on BARMM governance structure, officials, the 89 enacted BAAs, BDP targets, and the BOL. Every content skill invokes it first to prevent factual errors.
- **/fact-checker** runs after every document to verify names, titles, legislation references, and claims against authoritative sources.

**NotebookLM** handles research at scale. When I need to analyze 15 committee hearing transcripts or compare provisions across a dozen related laws, I load the sources into a notebook and let Google's servers do the heavy processing. The cost is zero. The output is citation-grounded — every claim traces back to a specific passage in a specific source. I use it for the research phase of any large document, then bring the findings into Claude Code for drafting.

**Obsidian** is my knowledge base. Every law I transcribe, every briefer I draft, every research finding I produce, every meeting note I take — it goes into an Obsidian vault with bidirectional links between notes. When I write a bill summary, I link it to the relevant BAA, the committee that reviewed it, the ministry it affects, and the BDP goal it supports. Over time, the vault becomes a map of Bangsamoro governance that no single document could contain.

**The workflow in practice:** When the Parliament prepares to deliberate a bill, I load the bill text and all related documents into NotebookLM for research. I invoke `/bangsamoro` in Claude Code to load governance context. I run `/legislative-briefer` to generate the 13-section analysis. I invoke `/fact-checker` to verify every citation. I save the output to my Obsidian vault, linked to every relevant note. The result: a comprehensive, fact-checked legislative briefer in hours instead of days.

This toolkit did not appear overnight. It accumulated over months of daily use, iteration, and correction. The skills improved because I used them, found errors, fixed them, and used them again. The vault grew because I fed it consistently. The workflow sharpened because I paid attention to where it broke and redesigned those points.

You do not need 129 skills to start. You need one task, one tool, and the discipline to verify every output. The rest builds from there.

---

# Appendix L — Cross-Reference Index to Other BARMM Guidebooks

This guidebook is part of a family of governance publications produced for BARMM. Each guidebook covers a different domain. This index shows where they connect.

| Guidebook | Relevant Chapters in This Guidebook | Key Connection |
|---|---|---|
| **Bill Drafting Guidebook for the Bangsamoro Parliament** | Ch. 7 (Legislative Work), Ch. 11 (Legislation and Codification), Appendix F, Appendix G | AI techniques for every stage of the legislative process documented in the Bill Drafting Guidebook. Appendix F maps the 13-section briefer format. Appendix G maps the BB-coded budget briefer. |
| **Complete Staff Work (CSW) Guidebook for BARMM** | Ch. 3 (AI-Augmented Workflow), Appendix E | Appendix E maps AI assistance to every step of the ADDRESS IT methodology. Chapter 3's four-step workflow integrates directly with CSW procedures. |
| **Manual of Operations (MOP) Formulation Guidebook** | Ch. 8 (Implementation), Ch. 13 (Implementation Roadmap) | AI-integrated SOPs from Chapter 8 feed into MOP documentation. Chapter 13's adoption plan produces outputs that should be captured in the office MOP. |
| **Supervision and Supervisory Development Guidebook** | Ch. 14 (Training and Capacity), Ch. 13 (Change Management) | Supervisors play a defined role in AI adoption (Ch. 14, Sec. 14.3). The change management framework in Ch. 13 maps resistance patterns that supervisors must address. |
| **Strategic Planning Guidebook** | Ch. 5 (Strategic Planning), Ch. 9 (M&E) | AI techniques for environmental scanning, needs assessment, and results framework design |

| Guidebook | Relevant Chapters in This Guidebook | Key Connection |
|---|---|---|
| | | (Ch. 5) directly support the planning methodology in the Strategic Planning Guidebook. |
| **Speech Writing Guidebook** | Ch. 7 (Interpellation and Plenary Preparation), Ch. 8 (Government Communications) | AI-assisted speech drafting for parliamentary proceedings. Chapter 7 covers manifestations and interpellation statements. |
| **Policy Recommendations Guidebook** | Ch. 7 (Policy Recommendation Drafting), Appendix E (E.4 Explore Options) | AI techniques for options analysis and policy memo drafting align with the Bardach methodology in the Policy Recommendations Guidebook. |

---

[^1]: For the complete ADDRESS IT methodology, see: *Complete Staff Work Guidebook for BARMM*, Chapters 3-9. The methodology was developed specifically for Bangsamoro government staff work and is referenced throughout this guidebook.

[^2]: *Complete Staff Work Guidebook for BARMM*. The guidebook provides the full procedural framework; this appendix focuses exclusively on AI integration at each step.

[^3]: *Bill Drafting Guidebook for the Bangsamoro Parliament*, particularly Chapters 7-8 on legislative briefers and committee procedures.

[^4]: *Bill Drafting Guidebook for the Bangsamoro Parliament*, Chapter 9: Budget Analysis and Appropriations Review.

# Bibliography

# A. Primary Legal Sources

## Constitution

Constitution of the Republic of the Philippines (1987).

## Republic Acts

Republic Act No. 7941, An Act Providing for the Election of Party-List Representatives Through the Party-List System, and Appropriating Funds Therefor (1995).

Republic Act No. 9184, An Act Providing for the Modernization, Standardization, and Regulation of the Procurement Activities of the Government and for Other Purposes (Government Procurement Reform Act) (2003), and its Revised Implementing Rules and Regulations (2016).

Republic Act No. 10173, An Act Protecting Individual Personal Information in Information and Communications Systems in the Government and the Private Sector, Creating for this Purpose a National Privacy Commission, and for Other Purposes (Data Privacy Act of 2012).

Republic Act No. 11054, An Act Providing for the Organic Law for the Bangsamoro Autonomous Region in Muslim Mindanao, Repealing for the Purpose Republic Act No. 6734, Entitled "An Act Providing for an Organic Act for the Autonomous Region in Muslim Mindanao," as amended by Republic Act No. 9054, Entitled "An Act to Strengthen and Expand the Organic Act for the Autonomous Region in Muslim Mindanao, Amending for the Purpose Republic Act No. 6734, Entitled 'An Act Providing for an Organic Act for the Autonomous Region in Muslim Mindanao,' as Amended" (Bangsamoro Organic Law) (July 27, 2018).

Republic Act No. 11593, An Act Postponing the June 2022 Bangsamoro Autonomous Region in Muslim Mindanao (BARMM) Parliamentary Elections, Resetting Them to May 2025, and Extending the Bangsamoro Transition Period (2021).

Republic Act No. 12009, An Act Providing for the Framework on the Modernization of Government Procurement Processes and for Other Purposes (New Government Procurement Act) (2024).

Republic Act No. 12064, An Act Further Extending the Bangsamoro Transition Period, Synchronizing the First Parliamentary Elections with the 2028 National and Local Elections, and for Other Purposes (2025).

## Executive Orders

Executive Order No. 91, Realigning the Province of Sulu Under Region IX (Zamboanga Peninsula) (July 30, 2025).

## Bangsamoro Autonomy Acts

Bangsamoro Autonomy Act No. 13, An Act Providing for the Bangsamoro Administrative Code and for Other Related Purposes (Bangsamoro Administrative Code) (October 28, 2020).

Bangsamoro Autonomy Act No. 17, An Act Providing for the Bangsamoro Civil Service Code (Bangsamoro Civil Service Code) (February 2021).

Bangsamoro Autonomy Act No. 18, An Act Providing for the Bangsamoro Education Code (Bangsamoro Education Code) (May 2021).

Bangsamoro Autonomy Act No. 35, An Act Providing for the Bangsamoro Electoral Code (Bangsamoro Electoral Code) (2023).

Bangsamoro Autonomy Act No. 37, An Act Amending BAA No. 13, Book 1, Chapter 2, Section 9 (Seat of Government).

Bangsamoro Autonomy Act No. 41 through BAA No. 48, Acts Creating the Municipalities of the Special Geographic Area (SGA).

Bangsamoro Autonomy Act No. 49, An Act Establishing the Bangsamoro Human Rights Commission.

Bangsamoro Autonomy Act No. 54, An Act Creating the Municipality of Datu Sinsuat Balabaran.

Bangsamoro Autonomy Act No. 58, An Act Creating Parliamentary Districts in the Bangsamoro Autonomous Region (declared unconstitutional, *Ali et al. v. BTA*, G.R. No. E-02219, Sept. 30, 2025).

Bangsamoro Autonomy Act No. 70, An Act Amending BAA No. 54, Section 5.

Bangsamoro Autonomy Act No. 77, An Act Reconstituting Parliamentary Districts (declared unconstitutional, *Macapaar et al. v. COMELEC*, G.R. No. E-02235, Sept. 30, 2025).

Bangsamoro Autonomy Act No. 82, An Act Providing for the Bangsamoro Labor and Employment Code (Bangsamoro Labor and Employment Code).

Bangsamoro Autonomy Act No. 84, An Act Prescribing a Budget System for the Bangsamoro Government (Bangsamoro Budget System Act of 2025) (December 9, 2025).

Bangsamoro Autonomy Act No. 85, An Act Appropriating Funds for the Operation of the Bangsamoro Government from January One to December Thirty-One, Two Thousand Twenty-Six, and for Other Purposes (General Appropriations Act, FY 2026).

Bangsamoro Autonomy Act No. 86, An Act Establishing the Parliamentary Districts of the Bangsamoro Autonomous Region in Muslim Mindanao (Parliamentary District Act) (January 20, 2026).

Bangsamoro Autonomy Act No. 87, An Act Amending BAA No. 35 (Bangsamoro Electoral Code), First Amendment.

Bangsamoro Autonomy Act No. 88, An Act Amending BAA No. 35 (Bangsamoro Electoral Code), Second Amendment.

Bangsamoro Autonomy Act No. 89.

## Civil Service Commission Issuances

Civil Service Commission Memorandum Circular No. 72, s. 2019, Institutionalization of the Practice of Complete Staff Work in Government.

Civil Service Commission Memorandum Circular No. 2, s. 2022 (superseding MC No. 72, s. 2019).

## B. Peace Agreements

Comprehensive Agreement on the Bangsamoro (CAB), signed March 27, 2014, between the Government of the Republic of the Philippines and the Moro Islamic Liberation Front (MILF).

## C. Jurisprudence

*Ali et al. v. Bangsamoro Transition Authority*, G.R. No. E-02219 (Supreme Court of the Philippines, September 30, 2025). Declaring BAA 58 (Parliamentary Districts Creation) unconstitutional.

*Macapaar et al. v. Commission on Elections*, G.R. No. E-02235 (Supreme Court of the Philippines, September 30, 2025). Declaring BAA 77 (Reconstituted Parliamentary Districts) unconstitutional.

*Province of Sulu v. Medialdea*, G.R. Nos. 242255, 243246, 243693 (Supreme Court of the Philippines, September 9, 2024; finalized November 26, 2024). Upholding the constitutionality of the Bangsamoro Organic Law but ruling that Sulu is not part of BARMM.

## D. Bangsamoro Development Plan

Bangsamoro Planning and Development Authority. *2nd Bangsamoro Development Plan 2023-2028*. Cotabato City: BPDA, 2023.

- Chapter 4: Development Framework
- Chapter 5: Improving and Strengthening Governance
- Chapter 6: Cultural Diversity
- Chapter 8: Harnessing Technology and Innovations to Increase Socioeconomic Opportunities and Improve Government Services

## E. BARMM Governance Guidebooks by the Author

Mambayao, Saidamen R. *Bill Drafting Guidebook for the Bangsamoro Parliament: A Practical Guide for Members of Parliament, Parliamentary and Legislative Staff, Bill Drafters, and Consultants.* Cotabato City: Bangsamoro Transition Authority, 2026.

Mambayao, Saidamen R. *Complete Staff Work Guidebook for the Bangsamoro Autonomous Region: A Practical Guide to the ADDRESS IT Methodology for Completed Staff Work in the Bangsamoro Autonomous Region in Muslim Mindanao.* Cotabato City: Bangsamoro Transition Authority, 2026.

Mambayao, Saidamen R. *MOP Formulation Guidebook for BARMM Ministries, Offices, and Agencies: A Practical Guide for MOP Development Teams, Ministry Personnel, and Government Officers.* Cotabato City: Bangsamoro Transition Authority, 2026.

Mambayao, Saidamen R. *Strategic Planning Guidebook for the Bangsamoro Government: A Practitioner's Guide to the 10-Point Strategic Planning Framework for Ministries, Offices, and Agencies.* Cotabato City: Bangsamoro Transition Authority, 2026.

Mambayao, Saidamen R. *Supervision and Supervisory Development Guidebook for the Bangsamoro Autonomous Region: A Practical Guide for Directors, Division Chiefs, Section Heads, and Unit Supervisors.* Cotabato City: Bangsamoro Transition Authority, 2026.

# Appendix: AI Declaration

This guidebook was produced with AI assistance (Claude Code, Anthropic). AI was used for research compilation, cross-referencing legal sources, first-draft generation from verified fact sheets, fact-checking, citation formatting per the Philippine Manual of Legal Citations (Feliciano, 10th Ed., 2019), and PDF generation.

AI did not design the guidebook's structure, methodology, or recommendations. The analytical framework, practical guidance, and every substantive recommendation come from the author's direct experience in Bangsamoro governance. The author directed every research query, evaluated every result, and made every editorial decision.

Every legal provision cited was verified against the source text. Every BOL article number was checked against the 18-article map. Every BAA number was checked against the enacted BAA index. The author bears full responsibility for the accuracy and completeness of the published content.
